The authors have used their best efforts in preparing this material. These efforts include the development, research, and testing of the theories and programs to determine their effectiveness. No warranty of any kind, expressed or implied, with regard to the software or the material contained in this document is provided. No liability arising out of the application or use of any product described in this document is assumed. The authors reserve the right to revise this material and to make changes from time to time in the content hereof without obligation to notify anyone of such revision or changes.

The RTEMS Project is hosted at http://www.rtems.com. Any inquiries concerning RTEMS, its related support components, its documentation, or any custom services for RTEMS should be directed to the contacts listed on that site. A current list of RTEMS Support Providers is at http://www.rtems.com/support.html.
Table of Contents

Preface ...................................................... 1

1 Process Creation and Execution Manager ... 3
   1.1 Introduction ............................................. 3
   1.2 Background ............................................. 3
   1.3 Operations ............................................. 3
   1.4 Directives ............................................. 3
      1.4.1 fork - Create a Process ......................... 4
      1.4.2 execl - Execute a File ......................... 5
      1.4.3 execv - Execute a File ......................... 6
      1.4.4 execlp - Execute a File ....................... 7
      1.4.5 execle - Execute a File ....................... 8
      1.4.6 execvp - Execute a File ....................... 9
      1.4.7 _exit - Terminate a Process ................... 14

2 Signal Manager ........................................... 15
   2.1 Introduction ........................................... 15
   2.2 Background ........................................... 15
      2.2.1 Signals ........................................... 15
      2.2.2 Signal Delivery ................................... 16
   2.3 Operations ........................................... 16
      2.3.1 Signal Set Management ......................... 16
      2.3.2 Blocking Until Signal Generation ............ 16
      2.3.3 Sending a Signal ................................. 17
   2.4 Directives ........................................... 17
      2.4.1 sigaddset - Add a Signal to a Signal Set ...... 18
      2.4.2 sigdelset - Delete a Signal from a Signal Set .. 19
      2.4.3 sigfillset - Fill a Signal Set ................. 20
      2.4.4 sigismember - Is Signal a Member of a Signal Set .................. 21
      2.4.5 sigemptyset - Empty a Signal Set ............. 22
      2.4.6 sigaction - Examine and Change Signal Action .. 23
      2.4.7 pthread_kill - Send a Signal to a Thread ....... 24
      2.4.8 sigprocmask - Examine and Change Process Blocked Signals .................. 25
      2.4.9 pthread_sigmask - Examine and Change Thread Blocked Signals ............ 26
      2.4.10 kill - Send a Signal to a Process ............. 27
<table>
<thead>
<tr>
<th>Section</th>
<th>Function</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.4.11</td>
<td>sigpending - Examine Pending Signals</td>
<td>28</td>
</tr>
<tr>
<td>2.4.12</td>
<td>sigsuspend - Wait for a Signal</td>
<td>29</td>
</tr>
<tr>
<td>2.4.13</td>
<td>pause - Suspend Process Execution</td>
<td>30</td>
</tr>
<tr>
<td>2.4.14</td>
<td>sigwait - Synchronously Accept a Signal</td>
<td>31</td>
</tr>
<tr>
<td>2.4.15</td>
<td>sigwaitinfo - Synchronously Accept a Signal with Timeout</td>
<td>32</td>
</tr>
<tr>
<td>2.4.16</td>
<td>sigtimedwait - Synchronously Accept a Signal with Timeout</td>
<td>33</td>
</tr>
<tr>
<td>2.4.17</td>
<td>sigqueue - Queue a Signal to a Process</td>
<td>34</td>
</tr>

3 Process Environment Manager ............ 37

3.1 Introduction ................................ 37
3.2 Background .................................. 37
  3.2.1 Users and Groups ......................... 37
  3.2.2 User and Group Names .................... 38
  3.2.3 Environment Variables .................... 38
3.3 Operations ................................. 38
  3.3.1 Accessing User and Group IDs ............ 38
  3.3.2 Accessing Environment Variables .......... 38
3.4 Directives ................................ 39
  3.4.1 getpid - Get Process ID ................ 40
  3.4.2 getppid - Get Parent Process ID .......... 41
  3.4.3 getuid - Get User ID .................... 42
  3.4.4 geteuid - Get Effective User ID ........ 43
  3.4.5 getgid - Get Real Group ID ............. 44
  3.4.6 getegid - Get Effective Group ID ....... 45
  3.4.7 setuid - Set User ID ................... 46
  3.4.8 setgid - Set Group ID .................. 47
  3.4.9 getgroups - Get Supplementary Group IDs .. 48
  3.4.10 getlogin - Get User Name ............... 49
  3.4.11 getlogin_r - Reentrant Get User Name .. 50
  3.4.12 getpgid - Get Process Group ID .......... 51
  3.4.13 setsid - Create Session and Set Process Group ID .................................. 52
  3.4.14 setpgid - Set Process Group ID for Job Control .................. 53
  3.4.15 uname - Get System Name ............... 54
  3.4.16 times - Get process times .............. 55
  3.4.17 getenv - Get Environment Variables ..... 56
  3.4.18 setenv - Set Environment Variables ...... 57
  3.4.19 ctermid - Generate Terminal Pathname .. 58
  3.4.20 ttyname - Determine Terminal Device Name ........................................ 59
  3.4.21 ttyname_r - Reentrant Determine Terminal Device Name .......................... 60
  3.4.22 isatty - Determine if File Descriptor is Terminal .................................. 61
  3.4.23 sysconf - Get Configurable System Variables .......... 62
4 Files and Directories Manager .......... 63
  4.1 Introduction ........................................ 63
  4.2 Background ......................................... 64
    4.2.1 Path Name Evaluation .......................... 64
  4.3 Operations .......................................... 64
  4.4 Directives .......................................... 64
    4.4.1 opendir - Open a Directory .................... 65
    4.4.2 readdir - Reads a directory .................... 66
    4.4.3 rewinddir - Resets the readdir() pointer ...... 67
    4.4.4 scandir - Scan a directory for matching entries... 68
    4.4.5 telldir - Return current location in directory stream
                     ........................................... 69
    4.4.6 closedir - Ends directory read operation ..... 70
    4.4.7 chdir - Changes the current working directory... 71
    4.4.8 fchdir - Changes the current working directory... 72
    4.4.9 getcwd - Gets current working directory ....... 73
    4.4.10 open - Opens a file ............................ 74
    4.4.11 creat - Create a new file or rewrite an existing one
                     ........................................... 76
    4.4.12 umask - Sets a file creation mask ............. 78
    4.4.13 link - Creates a link to a file ............... 79
    4.4.14 symlink - Creates a symbolic link to a file ... 80
    4.4.15 readlink - Obtain the name of a symbolic link
destination .............................................. 81
    4.4.16 mkdir - Makes a directory ...................... 82
    4.4.17 mkfifo - Makes a FIFO special file ............ 83
    4.4.18 unlink - Removes a directory entry .......... 84
    4.4.19 rmdir - Delete a directory .................... 85
    4.4.20 rename - Renames a file ....................... 87
    4.4.21 stat - Gets information about a file ........ 89
    4.4.22 fstat - Gets file status ...................... 90
    4.4.23 lstat - Gets file status ...................... 91
    4.4.24 access - Check permissions for a file ....... 92
    4.4.25 chmod - Changes file mode ..................... 93
    4.4.26 fchmod - Changes permissions of a file ....... 94
    4.4.27 getdents - Get directory entries ............. 95
    4.4.28 chown - Changes the owner and/or group of a file.
                     ........................................... 96
    4.4.29 utime - Change access and/or modification times of
an inode .................................................. 97
    4.4.30 ftruncate - truncate a file to a specified length .. 98
    4.4.31 truncate - truncate a file to a specified length .. 99
    4.4.32 pathconf - Gets configuration values for files .. 100
    4.4.33 fpathconf - Gets configuration values for files .. 102
    4.4.34 mknod - create a directory ................... 104
5 Input and Output Primitives Manager 107

5.1 Introduction 107
5.2 Background 107
5.3 Operations 107
5.4 Directives 108
   5.4.1 pipe - Create an Inter-Process Channel 109
   5.4.2 dup - Duplicates an open file descriptor 110
   5.4.3 dup2 - Duplicates an open file descriptor 111
   5.4.4 close - Closes a file 112
   5.4.5 read - Reads from a file 113
   5.4.6 write - Writes to a file 115
   5.4.7 fcntl - Manipulates an open file descriptor 116
   5.4.8 lseek - Reposition read/write file offset 118
   5.4.9 fsync - Synchronize file complete in-core state with
       that on disk 119
   5.4.10 fdatasync - Synchronize file in-core data with that
       on disk 120
   5.4.11 mount - Mount a file system 121
   5.4.12 umount - Unmount file systems 122
   5.4.13 aio_read - Asynchronous Read 123
   5.4.14 aio_write - Asynchronous Write 124
   5.4.15 lio_listio - List Directed I/O 125
   5.4.16 aio_error - Retrieve Error Status of Asynchronous
       I/O Operation 126
   5.4.17 aio_return - Retrieve Return Status Asynchronous
       I/O Operation 127
   5.4.18 aio_cancel - Cancel Asynchronous I/O Request
       128
   5.4.19 aio_suspend - Wait for Asynchronous I/O Request
       129
   5.4.20 aio_fsync - Asynchronous File Synchronization
       130

6 Device- and Class- Specific Functions Manager 131

6.1 Introduction 131
6.2 Background 131
6.3 Operations 131
6.4 Directives 131
   6.4.1 cfgetispeed - Reads terminal input baud rate 132
   6.4.2 cfgetospeed - Reads terminal output baud rate 133
   6.4.3 cfsetispeed - Sets terminal input baud rate 134
   6.4.4 cfsetospeed - Sets terminal output baud rate 135
   6.4.5 tcgetattr - Gets terminal attributes 136
   6.4.6 tcsetattr - Set terminal attributes 137
   6.4.7 tcsendbreak - Sends a break to a terminal 138
   6.4.8 tcdrain - Waits for all output to be transmitted to
       the terminal 139
6.4.9 tcflush - Discards terminal data................. 140
6.4.10 tcflow - Suspends/restarts terminal output..... 141
6.4.11 tcgetpgrp - Gets foreground process group ID..... 142
6.4.12 tcsetpgrp - Sets foreground process group ID..... 143

7 Language-Specific Services for the C
Programming Language Manager ........ 145

7.1 Introduction ............................................. 145
7.2 Background ................................................ 145
7.3 Operations ............................................... 145
7.4 Directives .................................................. 146
7.4.1 setlocale - Set the Current Locale.............. 147
7.4.2 fileno - Obtain File Descriptor Number for this File
................................................................. 148
7.4.3 fdopen - Associate Stream with File Descriptor... 149
7.4.4 flockfile - Acquire Ownership of File Stream.... 150
7.4.5 ftrylockfile - Poll to Acquire Ownership of File
Stream............................................................ 151
7.4.6 funlockfile - Release Ownership of File Stream.. 152
7.4.7 getc_unlocked - Get Character without Locking... 153
7.4.8 getchar_unlocked - Get Character from stdin without
Locking.......................................................... 154
7.4.9 putc_unlocked - Put Character without Locking
................................................................. 155
7.4.10 putchar_unlocked - Put Character to stdin without
Locking.......................................................... 156
7.4.11 setjmp - Save Context for Non-Local Goto...... 157
7.4.12 longjmp - Non-Local Jump to a Saved Context
................................................................. 158
7.4.13 sigsetjmp - Save Context with Signal Status for
Non-Local Goto.............................................. 159
7.4.14 siglongjmp - Non-Local Jump with Signal Status to
a Saved Context.............................................. 160
7.4.15 tzset - Initialize Time Conversion Information... 161
7.4.16 strtok_r - Reentrant Extract Token from String
................................................................. 162
7.4.17 asctime_r - Reentrant struct tm to ASCII Time
Conversion...................................................... 163
7.4.18 ctime_r - Reentrant time_t to ASCII Time
Conversion...................................................... 164
7.4.19 gmtime_r - Reentrant UTC Time Conversion.... 165
7.4.20 localtime_r - Reentrant Local Time Conversion
................................................................. 166
7.4.21 rand_r - Reentrant Random Number Generation
............................................................... 167
8 System Databases Manager .......... 169
  8.1 Introduction .......................... 169
  8.2 Background ........................... 169
  8.3 Operations ........................... 169
  8.4 Directives ............................ 169
    8.4.1 getgrgid - Get Group File Entry for ID .... 170
    8.4.2 getgrgid_r - Reentrant Get Group File Entry ... 171
    8.4.3 getgrnam - Get Group File Entry for Name ... 172
    8.4.4 getgrnam_r - Reentrant Get Group File Entry for Name 173
    8.4.5 getpwuid - Get Password File Entry for UID ... 174
    8.4.6 getpwuid_r - Reentrant Get Password File Entry for UID 175
    8.4.7 getpwnam - Password File Entry for Name ... 176
    8.4.8 getpwnam_r - Reentrant Get Password File Entry for Name 177

9 Semaphore Manager ................... 179
  9.1 Introduction .......................... 179
  9.2 Background ........................... 179
    9.2.1 Theory .......................... 179
    9.2.2 "sem_t" Structure ................. 179
    9.2.3 Building a Semaphore Attribute Set ........ 179
  9.3 Operations ........................... 180
    9.3.1 Using as a Binary Semaphore ...... 180
  9.4 Directives ............................ 180
    9.4.1 sem_init - Initialize an unnamed semaphore ... 181
    9.4.2 sem_destroy - Destroy an unnamed semaphore ... 182
    9.4.3 sem_open - Open a named semaphore ........ 183
    9.4.4 sem_close - Close a named semaphore ...... 185
    9.4.5 sem_unlink - Unlink a semaphore .......... 186
    9.4.6 sem_wait - Wait on a Semaphore .......... 187
    9.4.7 sem_trywait - Non-blocking Wait on a Semaphore .......... 188
    9.4.8 sem_timedwait - Wait on a Semaphore for a Specified Time .... 189
    9.4.9 sem_post - Unlock a Semaphore ........ 190
    9.4.10 sem_getvalue - Get the value of a semaphore ... 191
10 Mutex Manager ........................................ 193
  10.1 Introduction ........................................ 193
  10.2 Background ......................................... 193
     10.2.1 Mutex Attributes ............................... 193
     10.2.2 PTHREAD_MUTEX_INITIALIZER ................. 194
  10.3 Operations ......................................... 194
  10.4 Services ........................................... 194
     10.4.1 pthread_mutexattr_init - Initialize a Mutex
            Attribute Set .................................... 195
     10.4.2 pthread_mutexattr_destroy - Destroy a Mutex
            Attribute Set ..................................... 196
     10.4.3 pthread_mutexattr_setprotocol - Set the Blocking
            Protocol ........................................... 197
     10.4.4 pthread_mutexattr_getprotocol - Get the Blocking
            Protocol ........................................... 198
     10.4.5 pthread_mutexattr_setprioceiling - Set the Priority
            Ceiling ............................................ 199
     10.4.6 pthread_mutexattr_getprioceiling - Get the Priority
            Ceiling ............................................ 200
     10.4.7 pthread_mutexattr_setpshared - Set the Visibility
            .................................................... 201
     10.4.8 pthread_mutexattr_getpshared - Get the Visibility
            .................................................... 202
     10.4.9 pthread_mutex_init - Initialize a Mutex ........ 203
     10.4.10 pthread_mutex_destroy - Destroy a Mutex ....... 204
     10.4.11 pthread_mutex_lock - Lock a Mutex ............ 205
     10.4.12 pthread_mutex_trylock - Poll to Lock a Mutex
            ................................................... 206
     10.4.13 pthread_mutex_timedlock - Lock a Mutex with
            Timeout ............................................ 207
     10.4.14 pthread_mutex_unlock - Unlock a Mutex .......... 208
     10.4.15 pthread_mutex_setprioceiling - Dynamically Set
            the Priority Ceiling .............................. 209
     10.4.16 pthread_mutex_getprioceiling - Get the Current
            Priority Ceiling .................................... 210

11 Condition Variable Manager ................. 211
  11.1 Introduction ........................................ 211
  11.2 Background ......................................... 211
  11.3 Operations ......................................... 211
  11.4 Directives ......................................... 211
     11.4.1 pthread_condattr_init - Initialize a Condition
            Variable Attribute Set ............................. 212
     11.4.2 pthread_condattr_destroy - Destroy a Condition
            Variable Attribute Set ............................. 213
     11.4.3 pthread_condattr_setpshared - Set Process Shared
            Attribute ........................................... 214
11.4.4  pthread_condattr_getpshared - Get Process Shared
    Attribute.............................................................. 215
11.4.5  pthread_cond_init - Initialize a Condition Variable
                    ............................................................ 216
11.4.6  pthread_cond_destroy - Destroy a Condition
    Variable.............................................................. 217
11.4.7  pthread_cond_signal - Signal a Condition Variable
                    ............................................................ 218
11.4.8  pthread_cond_broadcast - Broadcast a Condition
    Variable.............................................................. 219
11.4.9  pthread_cond_wait - Wait on a Condition Variable
                    ............................................................ 220
11.4.10 pthread_cond_timedwait - Wait with Timeout a
    Condition Variable.................................................. 221

12  Memory Management Manager............. 223
12.1  Introduction................................. 223
12.2  Background..................................... 223
12.3  Operations.................................... 223
12.4  Directives.................................... 223
  12.4.1  mlockall - Lock the Address Space of a Process
                     ........................................................ 224
  12.4.2  munlockall - Unlock the Address Space of a Process
                     ........................................................ 225
  12.4.3  mlock - Lock a Range of the Process Address Space
                     ........................................................ 226
  12.4.4  munlock - Unlock a Range of the Process Address Space
                     ........................................................ 227
  12.4.5  mmap - Map Process Addresses to a Memory Object
                     ........................................................ 228
  12.4.6  munmap - Unmap Previously Mapped Addresses
                     ........................................................ 229
  12.4.7  mprotect - Change Memory Protection............. 230
  12.4.8  msync - Memory Object Synchronization............ 231
  12.4.9  shm_open - Open a Shared Memory Object........ 232
  12.4.10 shm_unlink - Remove a Shared Memory Object
                     ........................................................ 233
13 Scheduler Manager .......................... 235
  13.1 Introduction .................................. 235
  13.2 Background .................................. 235
    13.2.1 Priority ................................ 235
    13.2.2 Scheduling Policies ....................... 235
  13.3 Operations ................................... 236
  13.4 Directives ................................... 236
    13.4.1 sched_get_priority_min - Get Minimum Priority Value ......................... 237
    13.4.2 sched_get_priority_max - Get Maximum Priority Value .................... 238
    13.4.3 sched_rr_get_interval - Get Timeslicing Quantum ........................ 239
    13.4.4 sched_yield - Yield the Processor .................. 240

14 Clock Manager ............................... 241
  14.1 Introduction .................................. 241
  14.2 Background .................................. 241
  14.3 Operations ................................... 241
  14.4 Directives ................................... 241
    14.4.1 clock_gettime - Obtain Time of Day .......... 241
    14.4.2 clock_settime - Set Time of Day ............. 243
    14.4.3 clock_getres - Get Clock Resolution .......... 244
    14.4.4 sleep - Delay Process Execution .......... 245
    14.4.5 nanosleep - Delay with High Resolution .......... 246
    14.4.6 gettimeofday - Get the Time of Day ....... 247
    14.4.7 time - Get time in seconds .......... 248

15 Timer Manager ............................... 249
  15.1 Introduction .................................. 249
  15.2 Background .................................. 249
  15.3 Operations ................................... 249
  15.4 System Calls .................................. 249
    15.4.1 timer_create - Create a Per-Process Timer .... 250
    15.4.2 timer_delete - Delete a Per-Process Timer .... 251
    15.4.3 timer_settime - Set Next Timer Expiration .... 252
    15.4.4 timer_gettime - Get Time Remaining on Timer ........................ 253
    15.4.5 timer_getoverrun - Get Timer Overrun Count ... 254
16 Message Passing Manager

16.1 Introduction

16.2 Background

16.2.1 Theory

16.2.2 Messages

16.2.3 Message Queues

16.2.4 Building a Message Queue Attribute Set

16.2.5 Notification of a Message on the Queue

16.2.6 POSIX Interpretation Issues

16.3 Operations

16.3.1 Opening or Creating a Message Queue

16.3.2 Closing a Message Queue

16.3.3 Removing a Message Queue

16.3.4 Sending a Message to a Message Queue

16.3.5 Receiving a Message from a Message Queue

16.3.6 Notification of Receipt of a Message on an Empty Queue

16.3.7 Setting the Attributes of a Message Queue

16.3.8 Getting the Attributes of a Message Queue

16.4 Directives

16.4.1 mq_open - Open a Message Queue

16.4.2 mq_close - Close a Message Queue

16.4.3 mq_unlink - Remove a Message Queue

16.4.4 mq_send - Send a Message to a Message Queue

16.4.5 mq_receive - Receive a Message from a Message Queue

16.4.6 mq_notify - Notify Process that a Message is Available

16.4.7 mq_setattr - Set Message Queue Attributes

16.4.8 mq_getattr - Get Message Queue Attributes

17 Thread Manager

17.1 Introduction

17.2 Background

17.2.1 Thread Attributes

Preface

This is the User’s Guide for the POSIX API support provided in RTEMS.

The functionality described in this document is based on the following standards:

- POSIX 1003.1b-1993.
- POSIX 1003.1h/D3.

Much of the POSIX API standard is actually implemented in the Cygnus Newlib ANSI C Library. Please refer to documentation on Newlib for more information on the functionality it supplies.

This manual is still under construction and improvements are welcomed from users.
1 Process Creation and Execution Manager

1.1 Introduction

The process creation and execution manager provides the functionality associated with the creation and termination of processes.

The directives provided by the process creation and execution manager are:

- fork - Create a Process
- exec1 - Execute a File
- execv - Execute a File
- execle - Execute a File
- execve - Execute a File
- exec1p - Execute a File
- execvp - Execute a File
- pthread_atfork - Register Fork Handlers
- wait - Wait for Process Termination
- waitpid - Wait for Process Termination
- _exit - Terminate a Process

1.2 Background

POSIX process functionality cannot be completely supported by RTEMS. This is because RTEMS provides no memory protection and implements a single process, multi-threaded execution model. In this light, RTEMS provides none of the routines that are associated with the creation of new processes. However, since the entire RTEMS application (e.g. executable) is logically a single POSIX process, RTEMS is able to provide implementations of many operations on processes. The rule of thumb is that those routines provide a meaningful result. For example, getpid() returns the node number.

1.3 Operations

The only functionality method defined by this manager which is supported by RTEMS is the _exit service. The implementation of _exit shuts the application down and is equivalent to invoking either exit or rtems_shutdown_executive.

1.4 Directives

This section details the process creation and execution manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
1.4.1 fork - Create a Process

CALLING SEQUENCE:

```c
#include <sys/types.h>

int fork( void );
```

STATUS CODES:

**ENOSYS**  
This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.2 execl - Execute a File

CALLING SEQUENCE:

    int execl(
        const char *path,
        const char *arg,
        ...
    );

STATUS CODES:

ENOSYS       This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.3 execv - Execute a File

CALLING SEQUENCE:

    int execv(
        const char *path,
        char const *argv[],
        ...
    );

STATUS CODES:

ENOSYS This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.4 execle - Execute a File

**CALLING SEQUENCE:**

```c
int execle(
    const char *path,
    const char *arg,
    ...
);
```

**STATUS CODES:**

**ENOSYS** This routine is not supported by RTEMS.

**DESCRIPTION:**

This routine is not supported by RTEMS.

**NOTES:**

NONE
1.4.5 execve - Execute a File

CALLING SEQUENCE:

```c
int execve(
    const char *path,
    char *const argv[],
    char *const envp[]
);
```

STATUS CODES:

ENOSYS This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.6 execlp - Execute a File

CALLING SEQUENCE:

    int execlp(
        const char *file,
        const char *arg,
        ...  
    );

STATUS CODES:

ENOSYS         This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.7 execvp - Execute a File

CALLING SEQUENCE:

    int execvp(
            const char *file,
            char *const argv[]
            ...
    );

STATUS CODES:

ENOSYS This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.8 pthread_atfork - Register Fork Handlers

CALLING SEQUENCE:

```c
#include <sys/types.h>

int pthread_atfork(
    void (*prepare)(void),
    void (*parent)(void),
    void (*child)(void)
);
```

STATUS CODES:

**ENOSYS**

This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.9 wait - Wait for Process Termination

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/wait.h>

int wait(
    int *stat_loc
);
```

STATUS CODES:

ENOSYS This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.10 waitpid - Wait for Process Termination

CALLING SEQUENCE:

    int wait(
        pid_t pid,
        int *stat_loc,
        int options
    );

STATUS CODES:

ENOSYS This routine is not supported by RTEMS.

DESCRIPTION:

This routine is not supported by RTEMS.

NOTES:

NONE
1.4.11 _exit - Terminate a Process

CALLING SEQUENCE:

    void _exit(
            int status
    );

STATUS CODES:

NONE

DESCRIPTION:

The _exit() function terminates the calling process.

NOTES:

In RTEMS, a process is equivalent to the entire application on a single processor. Invoking this service terminates the application.
2 Signal Manager

2.1 Introduction

The signal manager provides the functionality associated with the generation, delivery, and management of process-oriented signals.

The directives provided by the signal manager are:

- `sigaddset` - Add a Signal to a Signal Set
- `sigdelset` - Delete a Signal from a Signal Set
- `sigfillset` - Fill a Signal Set
- `sigismember` - Is Signal a Member of a Signal Set
- `sigemptyset` - Empty a Signal Set
- `sigaction` - Examine and Change Signal Action
- `pthread_kill` - Send a Signal to a Thread
- `sigprocmask` - Examine and Change Process Blocked Signals
- `pthread_sigmask` - Examine and Change Thread Blocked Signals
- `kill` - Send a Signal to a Process
- `sigpending` - Examine Pending Signals
- `sigsuspend` - Wait for a Signal
- `pause` - Suspend Process Execution
- `sigwait` - Synchronously Accept a Signal
- `sigwaitinfo` - Synchronously Accept a Signal
- `sigtimedwait` - Synchronously Accept a Signal with Timeout
- `sigqueue` - Queue a Signal to a Process
- `alarm` - Schedule Alarm

2.2 Background

2.2.1 Signals

POSIX signals are an asynchronous event mechanism. Each process and thread has a set of signals associated with it. Individual signals may be enabled (e.g. unmasked) or blocked (e.g. ignored) on both a per-thread and process level. Signals which are enabled have a signal handler associated with them. When the signal is generated and conditions are met, then the signal handler is invoked in the proper process or thread context asynchronous relative to the logical thread of execution.
If a signal has been blocked when it is generated, then it is queued and kept pending until the thread or process unblocks the signal or explicitly checks for it. Traditional, non-real-time POSIX signals do not queue. Thus if a process or thread has blocked a particular signal, then multiple occurrences of that signal are recorded as a single occurrence of that signal.

One can check for the set of outstanding signals that have been blocked. Services are provided to check for outstanding process or thread directed signals.

### 2.2.2 Signal Delivery

Signals which are directed at a thread are delivered to the specified thread.

Signals which are directed at a process are delivered to a thread which is selected based on the following algorithm:

1. If the action for this signal is currently SIG_IGN, then the signal is simply ignored.
2. If the currently executing thread has the signal unblocked, then the signal is delivered to it.
3. If any threads are currently blocked waiting for this signal (sigwait()), then the signal is delivered to the highest priority thread waiting for this signal.
4. If any other threads are willing to accept delivery of the signal, then the signal is delivered to the highest priority thread of this set. In the event, multiple threads of the same priority are willing to accept this signal, then priority is given first to ready threads, then to threads blocked on calls which may be interrupted, and finally to threads blocked on non-interruptible calls.
5. In the event the signal still can not be delivered, then it is left pending. The first thread to unblock the signal (sigprocmask() or pthread_sigprocmask()) or to wait for this signal (sigwait()) will be the recipient of the signal.

### 2.3 Operations

#### 2.3.1 Signal Set Management

Each process and each thread within that process has a set of individual signals and handlers associated with it. Services are provided to construct signal sets for the purposes of building signal sets – type sigset_t – that are used to provide arguments to the services that mask, unmask, and check on pending signals.

#### 2.3.2 Blocking Until Signal Generation

A thread may block until receipt of a signal. The "sigwait" and "pause" families of services block until the requested signal is received or if using sigtimedwait() until the specified timeout period has elapsed.
2.3.3 Sending a Signal

This is accomplished via one of a number of services that sends a signal to either a process or thread. Signals may be directed at a process by the service `kill()` or at a thread by the service `pthread_kill()`.

2.4 Directives

This section details the signal manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
2.4.1 sigaddset - Add a Signal to a Signal Set

CALLING SEQUENCE:

```
#include <signal.h>

int sigaddset(
    sigset_t *set,
    int    signo
);
```

STATUS CODES:

EINVAL

Invalid argument passed.

DESCRIPTION:

This function adds the signo to the specified signal set.

NOTES:

NONE
### 2.4.2 sigdelset - Delete a Signal from a Signal Set

**CALLING SEQUENCE:**

```c
#include <signal.h>

int sigdelset(
    sigset_t *set,
    int    signo
);
```

**STATUS CODES:**

- **EINVAL**  
  Invalid argument passed.

**DESCRIPTION:**

This function deletes the `signo` to the specified signal `set`.

**NOTES:**

- **NONE**
2.4.3 sigfillset - Fill a Signal Set

CALLING SEQUENCE:

```c
#include <signal.h>

int sigfillset(
    sigset_t *set
);
```

STATUS CODES:

EINVAL Invalid argument passed.

DESCRIPTION:

This function fills the specified signal set such that all signals are set.

NOTES:

NONE
2.4.4 sigismember - Is Signal a Member of a Signal Set

CALLING SEQUENCE:

```c
#include <signal.h>

int sigismember(
    const sigset_t *set,
    int         signo
);
```

STATUS CODES:

EINVAL Invalid argument passed.

DESCRIPTION:

This function returns 1 if `signo` is a member of `set` and 0 otherwise.

NOTES:

NONE
2.4.5 sigemptyset - Empty a Signal Set

CALLING SEQUENCE:

```c
#include <signal.h>

int sigemptyset(
    sigset_t *set
);
```

STATUS CODES:

EINVAL        Invalid argument passed.

DESCRIPTION:

This function fills the specified signal set such that all signals are cleared.

NOTES:

NONE
2.4.6 sigaction - Examine and Change Signal Action

CALLING SEQUENCE:

```
#include <signal.h>

int sigaction(
    int sig,
    const struct sigaction *act,
    struct sigaction *oact
);
```

STATUS CODES:

EINVAL      Invalid argument passed.
ENOTSUP     Realtime Signals Extension option not supported.

DESCRIPTION:

This function is used to change the action taken by a process on receipt of the specific signal `sig`. The new action is specified by `act` and the previous action is returned via `oact`.

NOTES:

The signal number cannot be SIGKILL.
2.4.7 pthread_kill - Send a Signal to a Thread

CALLING SEQUENCE:

```c
#include <signal.h>

int pthread_kill(
    pthread_t thread,
    int sig
);
```

STATUS CODES:

- **ESRCH**: The thread indicated by the parameter thread is invalid.
- **EINVAL**: Invalid argument passed.

DESCRIPTION:

This function sends the specified signal `sig` to `thread`.

NOTES:

NONE
2.4.8 sigprocmask - Examine and Change Process Blocked Signals

CALLING SEQUENCE:

```c
#include <signal.h>

int sigprocmask(
    int how,
    const sigset_t *set,
    sigset_t *oset
);
```

STATUS CODES:

EINVAL Invalid argument passed.

DESCRIPTION:

This function is used to alter the set of currently blocked signals on a process wide basis. A blocked signal will not be received by the process. The behavior of this function is dependent on the value of `how` which may be one of the following:

SIG_BLOCK The set of blocked signals is set to the union of `set` and those signals currently blocked.

SIG_UNBLOCK The signals specific in `set` are removed from the currently blocked set.

SIG_SETMASK The set of currently blocked signals is set to `set`.

If `oset` is not NULL, then the set of blocked signals prior to this call is returned in `oset`.

NOTES:

It is not an error to unblock a signal which is not blocked.
### 2.4.9 pthread_sigmask - Examine and Change Thread Blocked Signals

**CALLING SEQUENCE:**

```c
#include <signal.h>

int pthread_sigmask(
    int how,
    const sigset_t *set,
    sigset_t *oset
);
```

**STATUS CODES:**

- **EINVAL**
  - Invalid argument passed.

**DESCRIPTION:**

This function is used to alter the set of currently blocked signals for the calling thread. A blocked signal will not be received by the process. The behavior of this function is dependent on the value of `how` which may be one of the following:

- **SIG_BLOCK**
  - The set of blocked signals is set to the union of `set` and those signals currently blocked.

- **SIG_UNBLOCK**
  - The signals specific in `set` are removed from the currently blocked set.

- **SIG_SETMASK**
  - The set of currently blocked signals is set to `set`.

If `oset` is not NULL, then the set of blocked signals prior to this call is returned in `oset`.

**NOTES:**

It is not an error to unblock a signal which is not blocked.
2.4.10 kill - Send a Signal to a Process

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <signal.h>

int kill(
    pid_t pid,
    int sig
);
```

STATUS CODES:

- **EINVAL**: Invalid argument passed.
- **EPERM**: Process does not have permission to send the signal to any receiving process.
- **ESRCH**: The process indicated by the parameter pid is invalid.

DESCRIPTION:

This function sends the signal `sig` to the process `pid`.

NOTES:

NONE
2.4.11 sigpending - Examine Pending Signals

CALLING SEQUENCE:

```c
#include <signal.h>

int sigpending(
    const sigset_t *set
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` to one of the following:

- `EFAULT` Invalid address for set.

DESCRIPTION:

This function allows the caller to examine the set of currently pending signals. A pending signal is one which has been raised but is currently blocked. The set of pending signals is returned in `set`.

NOTES:

NONE
2.4.12 sigsuspend - Wait for a Signal

CALLING SEQUENCE:

```c
#include <signal.h>

int sigsuspend(
    const sigset_t *sigmask
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` to one of the following:

- **EINTR**: Signal interrupted this function.

DESCRIPTION:

This function temporarily replaces the signal mask for the process with that specified by `sigmask` and blocks the calling thread until the signal is raised.

NOTES:

NONE
2.4.13 pause - Suspend Process Execution

CALLING SEQUENCE:

#include <signal.h>

int pause( void );

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

EINTR       Signal interrupted this function.

DESCRIPTION:

This function causes the calling thread to be blocked until an unblocked signal is received.

NOTES:

NONE
2.4.14 sigwait - Synchronously Accept a Signal

CALLING SEQUENCE:

```c
#include <signal.h>

int sigwait(
    const sigset_t *set,
    int *sig
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid argument passed.</td>
</tr>
<tr>
<td>EINTR</td>
<td>Signal interrupted this function.</td>
</tr>
</tbody>
</table>

DESCRIPTION:

This function selects a pending signal based on the set specified in `set`, atomically clears it from the set of pending signals, and returns the signal number for that signal in `sig`.

NOTES:

NONE
2.4.15 sigwaitinfo - Synchronously Accept a Signal

CALLING SEQUENCE:

```c
#include <signal.h>

int sigwaitinfo(
    const sigset_t *set,
    siginfo_t     *info
);
```

STATUS CODES:

EINTR   Signal interrupted this function.

DESCRIPTION:

This function selects a pending signal based on the set specified in `set`, atomically clears it from the set of pending signals, and returns information about that signal in `info`.

NOTES:

NONE
2.4.16 sigtimedwait - Synchronously Accept a Signal with Timeout

CALLING SEQUENCE:

```c
#include <signal.h>

int sigtimedwait(
    const sigset_t *set,
    siginfo_t *info,
    const struct timespec *timeout
);
```

STATUS CODES:

- **EAGAIN**: Timed out while waiting for the specified signal set.
- **EINVAL**: Nanoseconds field of the timeout argument is invalid.
- **EINTR**: Signal interrupted this function.

DESCRIPTION:

This function selects a pending signal based on the set specified in `set`, atomically clears it from the set of pending signals, and returns information about that signal in `info`. The calling thread will block up to `timeout` waiting for the signal to arrive.

NOTES:

If `timeout` is NULL, then the calling thread will wait forever for the specified signal set.
2.4.17 sigqueue - Queue a Signal to a Process

CALLING SEQUENCE:

```c
#include <signal.h>

int sigqueue(
    pid_t pid,
    int signo,
    const union sigval value
);
```

STATUS CODES:

- **EAGAIN**: No resources available to queue the signal. The process has already queued SIGQUEUE_MAX signals that are still pending at the receiver or the systemwide resource limit has been exceeded.
- **EINVAL**: The value of the signo argument is an invalid or unsupported signal number.
- **EPERM**: The process does not have the appropriate privilege to send the signal to the receiving process.
- **ESRCH**: The process pid does not exist.

DESCRIPTION:

This function sends the signal specified by `signo` to the process `pid`.

NOTES:

NONE
2.4.18 alarm - Schedule Alarm

CALLING SEQUENCE:

#include <signal.h>

unsigned int alarm(
    unsigned int seconds
);

STATUS CODES:

This call always succeeds.

DESCRIPTION:

If there was a previous alarm() request with time remaining, then this routine returns the number of seconds until that outstanding alarm would have fired. If no previous alarm() request was outstanding, then zero is returned.

NOTES:

NONE
Chapter 3: Process Environment Manager

3 Process Environment Manager

3.1 Introduction

The process environment manager is responsible for providing the functions related to user and group ID management.

The directives provided by the process environment manager are:

- `getpid` - Get Process ID
- `getppid` - Get Parent Process ID
- `getuid` - Get User ID
- `geteuid` - Get Effective User ID
- `getgid` - Get Real Group ID
- `getegid` - Get Effective Group ID
- `setuid` - Set User ID
- `setgid` - Set Group ID
- `getgroups` - Get Supplementary Group IDs
- `getlogin` - Get User Name
- `getlogin_r` - Reentrant Get User Name
- `getpgrp` - Get Process Group ID
- `setsid` - Create Session and Set Process Group ID
- `setpgid` - Set Process Group ID for Job Control
- `uname` - Get System Name
- `times` - Get Process Times
- `getenv` - Get Environment Variables
- `setenv` - Set Environment Variables
- `ctermid` - Generate Terminal Pathname
- `ttyname` - Determine Terminal Device Name
- `ttyname_r` - Reentrant Determine Terminal Device Name
- `isatty` - Determine if File Descriptor is Terminal
- `sysconf` - Get Configurable System Variables

3.2 Background

3.2.1 Users and Groups

RTEMS provides a single process, multi-threaded execution environment. In this light, the notion of user and group is somewhat without meaning. But RTEMS does provide services
to provide a synthetic version of user and group. By default, a single user and group is
associated with the application. Thus unless special actions are taken, every thread in the
application shares the same user and group Id. The initial rationale for providing user and
group Id functionality in RTEMS was for the filesystem infrastructure to implement file
permission checks. The effective user/group Id capability has since been used to implement
permissions checking by the ftpd server.

In addition to the "real" user and group Ids, a process may have an effective user/group Id.
This allows a process to function using a more limited permission set for certain operations.

3.2.2 User and Group Names

POSIX considers user and group Ids to be a unique integer that may be associated with a
name. This is usually accomplished via a file named /etc/passwd for user Id mapping and
/etc/groups for group Id mapping. Again, although RTEMS is effectively a single process
and thus single user system, it provides limited support for user and group names. When
configured with an appropriate filesystem, RTEMS will access the appropriate files to map
user and group Ids to names.

If these files do not exist, then RTEMS will synthesize a minimal version so this family
of services return without error. It is important to remember that a design goal of the
RTEMS POSIX services is to provide useable and meaningful results even though a full
process model is not available.

3.2.3 Environment Variables

POSIX allows for variables in the run-time environment. These are name/value pairs that
make be dynamically set and obtained by programs. In a full POSIX environment with
command line shell and multiple processes, environment variables may be set in one process
– such as the shell – and inherited by child processes. In RTEMS, there is only one process
and thus only one set of environment variables across all processes.

3.3 Operations

3.3.1 Accessing User and Group Ids

The user Id associated with the current thread may be obtain using the getuid() service.
Similarly, the group Id may be obtained using the getgid() service.

3.3.2 Accessing Environment Variables

The value associated with an environment variable may be obtained using the getenv() service and set using the putenv() service.
3.4 Directives

This section details the process environment manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
3.4.1 getpid - Get Process ID

CALLING SEQUENCE:

    int getpid( void );

STATUS CODES:

The process Id is returned.

DESCRIPTION:

This service returns the process Id.

NOTES:

NONE
3.4.2 getppid - Get Parent Process ID

CALLING SEQUENCE:

int getppid( void );

STATUS CODES:

The parent process Id is returned.

DESCRIPTION:

This service returns the parent process Id.

NOTES:

NONE
3.4.3 getuid - Get User ID

CALLING SEQUENCE:

    int getuid( void );

STATUS CODES:

The effective user Id is returned.

DESCRIPTION:

This service returns the effective user Id.

NOTES:

NONE
3.4.4 `geteuid` - Get Effective User ID

**CALLING SEQUENCE:**

```c
int geteuid( void );
```

**STATUS CODES:**

The effective group ID is returned.

**DESCRIPTION:**

This service returns the effective group ID.

**NOTES:**

NONE
3.4.5 getgid - Get Real Group ID

CALLING SEQUENCE:

    int getgid( void );

STATUS CODES:

The group Id is returned.

DESCRIPTION:

This service returns the group Id.

NOTES:

NONE
3.4.6 getegid - Get Effective Group ID

CALLING SEQUENCE:

    int getegid( void );

STATUS CODES:

The effective group Id is returned.

DESCRIPTION:

This service returns the effective group Id.

NOTES:

NONE
3.4.7 setuid - Set User ID

CALLING SEQUENCE:

    int setuid(
        uid_t uid
    );

STATUS CODES:

This service returns 0.

DESCRIPTION:

This service sets the user ID to uid.

NOTES:

NONE
3.4.8 setgid - Set Group ID

CALLING SEQUENCE:

    int setgid(
            gid_t  gid
    );

STATUS CODES:

This service returns 0.

DESCRIPTION:

This service sets the group Id to gid.

NOTES:

NONE
3.4.9 getgroups - Get Supplementary Group IDs

CALLING SEQUENCE:

```c
int getgroups(
    int gidsetsize,
    gid_t grouplist[]
);
```

STATUS CODES:

NA

DESCRIPTION:

This service is not implemented as RTEMS has no notion of supplemental groups.

NOTES:

If supported, this routine would only be allowed for the super-user.
3.4.10 getlogin - Get User Name

CALLING SEQUENCE:

    char *getlogin( void );

STATUS CODES:

Returns a pointer to a string containing the name of the current user.

DESCRIPTION:

This routine returns the name of the current user.

NOTES:

This routine is not reentrant and subsequent calls to getlogin() will overwrite the same buffer.
3.4.11 getlogin_r - Reentrant Get User Name

CALLING SEQUENCE:

```c
int getlogin_r(
    char *name,
    size_t namesize
);
```

STATUS CODES:

EINVAL The arguments were invalid.

DESCRIPTION:

This is a reentrant version of the `getlogin()` service. The caller specified their own buffer, `name`, as well as the length of this buffer, `namesize`.

NOTES:

NONE
3.4.12 getpgrp - Get Process Group ID

CALLING SEQUENCE:

    pid_t getpgrp( void );

STATUS CODES:

The process group ID is returned.

DESCRIPTION:

This service returns the current process group ID.

NOTES:

This routine is implemented in a somewhat meaningful way for RTEMS but is truly not functional.
3.4.13 setsid - Create Session and Set Process Group ID

CALLING SEQUENCE:

\[ \text{pid_t setsid( void );} \]

STATUS CODES:

EPERM The application does not have permission to create a process group.

DESCRIPTION:

This routine always returns EPERM as RTEMS has no way to create new processes and thus no way to create a new process group.

NOTES:

NONE
3.4.14 setpgid - Set Process Group ID for Job Control

CALLING SEQUENCE:

    int setpgid(
        pid_t pid,
        pid_t pgid
    );

STATUS CODES:

ENOSYS The routine is not implemented.

DESCRIPTION:

This service is not implemented for RTEMS as process groups are not supported.

NOTES:

NONE
3.4.15 uname - Get System Name

CALLING SEQUENCE:

```c
int uname(
    struct utsname *name
);
```

STATUS CODES:

EPERM The provided structure pointer is invalid.

DESCRIPTION:

This service returns system information to the caller. It does this by filling in the `struct utsname` format structure for the caller.

NOTES:

The information provided includes the operating system (RTEMS in all configurations), the node number, the release as the RTEMS version, and the CPU family and model. The CPU model name will indicate the multilib executive variant being used.
3.4.16 times - Get process times

CALLING SEQUENCE:

```c
#include <sys/time.h>

clock_t times(
    struct tms *ptms
);
```

STATUS CODES:

This routine returns the number of clock ticks that have elapsed since the system was initialized (e.g. the application was started).

DESCRIPTION:

times stores the current process times in ptms. The format of struct tms is as defined in <sys/times.h>. RTEMS fills in the field tms_utime with the number of ticks that the calling thread has executed and the field tms_stime with the number of clock ticks since system boot (also returned). All other fields in the ptms are left zero.

NOTES:

RTEMS has no way to distinguish between user and system time so this routine returns the most meaningful information possible.
3.4.17 getenv - Get Environment Variables

CALLING SEQUENCE:

```c
char *getenv(
    const char *name
);
```

STATUS CODES:

- NULL when no match
- pointer to value when successful

DESCRIPTION:

This service searches the set of environment variables for a string that matches the specified `name`. If found, it returns the associated value.

NOTES:

The environment list consists of name value pairs that are of the form `name = value`. 
3.4.18 setenv - Set Environment Variables

CALLING SEQUENCE:

    int setenv(
       const char *name,
       const char *value,
       int overwrite
    );

STATUS CODES:

Returns 0 if successful and -1 otherwise.

DESCRIPTION:

This service adds the variable name to the environment with value. If name is not already exist, then it is created. If name exists and overwrite is zero, then the previous value is not overwritten.

NOTES:

NONE
3.4.19 ctermid - Generate Terminal Pathname

CALLING SEQUENCE:

    char *ctermid(
        char *s
    );

STATUS CODES:

Returns a pointer to a string indicating the pathname for the controlling terminal.

DESCRIPTION:

This service returns the name of the terminal device associated with this process. If s is NULL, then a pointer to a static buffer is returned. Otherwise, s is assumed to have a buffer of sufficient size to contain the name of the controlling terminal.

NOTES:

By default on RTEMS systems, the controlling terminal is /dev/console. Again this implementation is of limited meaning, but it provides true and useful results which should be sufficient to ease porting applications from a full POSIX implementation to the reduced profile supported by RTEMS.
3.4.20 tttname - Determine Terminal Device Name

CALLING SEQUENCE:

```c
char *ttname(
    int fd
);
```

STATUS CODES:

Pointer to a string containing the terminal device name or NULL is returned on any error.

DESCRIPTION:

This service returns a pointer to the pathname of the terminal device that is open on the file descriptor `fd`. If `fd` is not a valid descriptor for a terminal device, then NULL is returned.

NOTES:

This routine uses a static buffer.
3.4.21 ttname_r - Reentrant Determine Terminal Device Name

CALLING SEQUENCE:

```c
int ttname_r(
    int fd,
    char *name,
    int namesize
);
```

STATUS CODES:

This routine returns -1 and sets `errno` as follows:

- **EBADF** If not a valid descriptor for a terminal device.
- **EINVAL** If `name` is NULL or `namesize` are insufficient.

DESCRIPTION:

This service the pathname of the terminal device that is open on the file descriptor `fd`.

NOTES:

NONE
3.4.22 isatty - Determine if File Descriptor is Terminal

CALLING SEQUENCE:

    int isatty(
        int fd
    );

STATUS CODES:

Returns 1 if \texttt{fd} is a terminal device and 0 otherwise.

DESCRIPTION:

This service returns 1 if \texttt{fd} is an open file descriptor connected to a terminal and 0 otherwise.

NOTES:
3.4.23 sysconf - Get Configurable System Variables

CALLING SEQUENCE:

long sysconf(  
    int name  
);  

STATUS CODES:

The value returned is the actual value of the system resource. If the requested configuration name is a feature flag, then 1 is returned if the available and 0 if it is not. On any other error condition, -1 is returned.

DESCRIPTION:

This service is the mechanism by which an application determines values for system limits or options at runtime.

NOTES:

Much of the information that may be obtained via sysconf has equivalent macros in <unistd.h. However, those macros reflect conservative limits which may have been altered by application configuration.
4 Files and Directories Manager

4.1 Introduction

The files and directories manager is ...

The directives provided by the files and directories manager are:

- `opendir` - Open a Directory
- `readdir` - Reads a directory
- `rewinddir` - Resets the `readdir()` pointer
- `scandir` - Scan a directory for matching entries
- `telldir` - Return current location in directory stream
- `closedir` - Ends directory read operation
- `getdents` - Get directory entries
- `chdir` - Changes the current working directory
- `fchdir` - Changes the current working directory
- `getcwd` - Gets current working directory
- `open` - Opens a file
- `creat` - Create a new file or rewrite an existing one
- `umask` - Sets a file creation mask
- `link` - Creates a link to a file
- `symlink` - Creates a symbolic link to a file
- `readlink` - Obtain the name of the link destination
- `mkdir` - Makes a directory
- `mkfifo` - Makes a FIFO special file
- `unlink` - Removes a directory entry
- `rmdir` - Delete a directory
- `rename` - Renames a file
- `stat` - Gets information about a file
- `fstat` - Gets file status
- `lstat` - Gets file status
- `access` - Check permissions for a file.
- `chmod` - Changes file mode
- `fchmod` - Changes permissions of a file
- `chown` - Changes the owner and/or group of a file
- `utime` - Change access and/or modification times of an inode
- `ftruncate` - Truncate a file to a specified length
- `truncate` - Truncate a file to a specified length
• pathconf - Gets configuration values for files
• fpathconf - Get configuration values for files
• mknod - Create a directory

4.2 Background

4.2.1 Path Name Evaluation

A pathname is a string that consists of no more than PATH_MAX bytes, including the terminating null character. A pathname has an optional beginning slash, followed by zero or more filenames separated by slashes. If the pathname refers to a directory, it may also have one or more trailing slashes. Multiple successive slashes are considered to be the same as one slash.

POSIX allows a pathname that begins with precisely two successive slashes to be interpreted in an implementation-defined manner. RTEMS does not currently recognize this as a special condition. Any number of successive slashes is treated the same as a single slash. POSIX requires that an implementation treat more than two leading slashes as a single slash.

4.3 Operations

There is currently no text in this section.

4.4 Directives

This section details the files and directories manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
4.4.1 opendir - Open a Directory

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <dirent.h>

int opendir(
    const char *dirname
);
```

STATUS CODES:

- **EACCES**: Search permission was denied on a component of the path prefix of `dirname`, or read permission is denied.
- **EMFILE**: Too many file descriptors in use by process.
- **ENFILE**: Too many files are currently open in the system.
- **ENOENT**: Directory does not exist, or `name` is an empty string.
- **ENOMEM**: Insufficient memory to complete the operation.
- **ENOTDIR**: `name` is not a directory.

DESCRIPTION:

This routine opens a directory stream corresponding to the directory specified by the `dirname` argument. The directory stream is positioned at the first entry.

NOTES:

The routine is implemented in Cygnus newlib.
4.4.2 readdir - Reads a directory

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <dirent.h>

int readdir(
    DIR *dirp
);
```

STATUS CODES:

EBADF Invalid file descriptor

DESCRIPTION:

The `readdir()` function returns a pointer to a structure `dirent` representing the next directory entry from the directory stream pointed to by `dirp`. On end-of-file, NULL is returned.

The `readdir()` function may (or may not) return entries for . or .. Your program should tolerate reading dot and dot-dot but not require them.

The data pointed to be `readdir()` may be overwritten by another call to `readdir()` for the same directory stream. It will not be overwritten by a call for another directory.

NOTES:

If `ptr` is not a pointer returned by `malloc()`, `calloc()`, or `realloc()` or has been deallocated with `free()` or `realloc()`, the results are not portable and are probably disastrous.

The routine is implemented in Cygnus newlib.
4.4.3 rewinddir - Resets the readdir() pointer

**CALLING SEQUENCE:**

```c
#include <sys/types.h>
#include <dirent.h>

void rewinddir(
    DIR *dirp
);
```

**STATUS CODES:**

No value is returned.

**DESCRIPTION:**

The `rewinddir()` function resets the position associated with the directory stream pointed to by `dirp`. It also causes the directory stream to refer to the current state of the directory.

**NOTES:**

NONE

If `dirp` is not a pointer by `opendir()`, the results are undefined.

The routine is implemented in Cygnus newlib.
4.4.4 scandir - Scan a directory for matching entries

CALLING SEQUENCE:

```c
#include <dirent.h>

int scandir(
    const char *dir,
    struct dirent ***namelist,
    int (*select)(const struct dirent *),
    int (*compar)(const struct dirent **, const struct dirent **)
);
```

STATUS CODES:

ENOMEM  Insufficient memory to complete the operation.

DESCRIPTION:

The `scandir()` function scans the directory `dir`, calling `select()` on each directory entry. Entries for which `select()` returns non-zero are stored in strings allocated via `malloc()`, sorted using `qsort()` with the comparison function `compar()`, and collected in array `namelist` which is allocated via `malloc()`. If `select` is NULL, all entries are selected.

NOTES:

The routine is implemented in Cygnus newlib.
4.4.5 telldir - Return current location in directory stream

CALLING SEQUENCE:

```c
#include <dirent.h>

off_t telldir(
        DIR *dir
    );
```

STATUS CODES:

EBADF Invalid directory stream descriptor dir.

DESCRIPTION:

The telldir() function returns the current location associated with the directory stream dir.

NOTES:

The routine is implemented in Cygnus newlib.
4.4.6 closedir - Ends directory read operation

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <dirent.h>

int closedir(
    DIR *dirp
);
```

STATUS CODES:

EBADF     Invalid file descriptor

DESCRIPTION:

The directory stream associated with `dirp` is closed. The value in `dirp` may not be usable after a call to `closedir()`.

NOTES:

NONE

The argument to `closedir()` must be a pointer returned by `opendir()`. If it is not, the results are not portable and most likely unpleasant.

The routine is implemented in Cygnus newlib.
4.4.7 chdir - Changes the current working directory

CALLING SEQUENCE:

```c
#include <unistd.h>

int chdir(
    const char *path
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` to one of the following:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOTDIR**: A component of the specified pathname was not a directory when directory was expected.

DESCRIPTION:

The `chdir()` function causes the directory named by `path` to become the current working directory; that is, the starting point for searches of pathnames not beginning with a slash. If `chdir()` detects an error, the current working directory is not changed.

NOTES:

NONE
4.4.8 fchdir - Changes the current working directory

CALLING SEQUENCE:

```c
#include <unistd.h>

int fchdir(
    int fd
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` to one of the following:

- **EACCES**
  Search permission is denied for a directory in a file’s path prefix.

- **ENAMETOOLONG**
  Length of a filename string exceeds PATH_MAX and `POSIX_NO_TRUNC` is in effect.

- **ENOENT**
  A file or directory does not exist.

- **ENOTDIR**
  A component of the specified pathname was not a directory when directory was expected.

DESCRIPTION:

The `fchdir()` function causes the directory named by `fd` to become the current working directory; that is, the starting point for searches of pathnames not beginning with a slash.

If `fchdir()` detects an error, the current working directory is not changed.

NOTES:

NONE
4.4.9 getcwd - Gets current working directory

**CALLING SEQUENCE:**

```
#include <unistd.h>

int getcwd( void );
```

**STATUS CODES:**

- **EINVAL** Invalid argument
- **ERANGE** Result is too large
- **EACCES** Search permission is denied for a directory in a file’s path prefix.

**DESCRIPTION:**

The `getcwd()` function copies the absolute pathname of the current working directory to the character array pointed to by `buf`. The `size` argument is the number of bytes available in `buf`.

**NOTES:**

There is no way to determine the maximum string length that `fgetcwd()` may need to return. Applications should tolerate getting **ERANGE** and allocate a larger buffer.

It is possible for `getcwd()` to return **EACCES** if, say, `login` puts the process into a directory without read access.

The 1988 standard uses `int` instead of `size_t` for the second parameter.
4.4.10 open - Opens a file

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

int open(
    const char *path,
    int oflag,
    mode_t mode
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **EEXIST**: The named file already exists.
- **EINTR**: Function was interrupted by a signal.
- **EISDIR**: Attempt to open a directory for writing or to rename a file to be a directory.
- **EMFILE**: Too many file descriptors are in use by this process.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.
- **ENFILE**: Too many files are currently open in the system.
- **ENOENT**: A file or directory does not exist.
- **ENOSPC**: No space left on disk.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.
- **ENXIO**: No such device. This error may also occur when a device is not ready, for example, a tape drive is off-line.
- **EROFS**: Read-only file system.

DESCRIPTION:

The `open` function establishes a connection between a file and a file descriptor. The file descriptor is a small integer that is used by I/O functions to reference the file. The `path` argument points to the pathname for the file.

The `oflag` argument is the bitwise inclusive OR of the values of symbolic constants. The programmer must specify exactly one of the following three symbols:
### Chapter 4: Files and Directories Manager

#### O_RDONLY
Open for reading only.

#### O_WRONLY
Open for writing only.

#### O_RDWR
Open for reading and writing.

Any combination of the following symbols may also be used.

- **O_APPEND**: Set the file offset to the end-of-file prior to each write.
- **O_CREAT**: If the file does not exist, allow it to be created. This flag indicates that the `mode` argument is present in the call to `open`.
- **O_EXCL**: This flag may be used only if `O_CREAT` is also set. It causes the call to `open` to fail if the file already exists.
- **O_NOCTTY**: If `path` identifies a terminal, this flag prevents that terminal from becoming the controlling terminal for this process. See Chapter 8 for a description of terminal I/O.
- **O_NONBLOCK**: Do not wait for the device or file to be ready or available. After the file is open, the `read` and `write` calls return immediately. If the process would be delayed in the read or write operation, -1 is returned and `errno` is set to `EAGAIN` instead of blocking the caller.
- **O_TRUNC**: This flag should be used only on ordinary files opened for writing. It causes the file to be truncated to zero length.

Upon successful completion, `open` returns a non-negative file descriptor.

### NOTES:

NONE
4.4.11 creat - Create a new file or rewrite an existing one

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

int creat(
    const char *path,
    mode_t mode
);
```

STATUS CODES:

- **EEXIST**: path already exists and O_CREAT and O_EXCL were used.
- **EISDIR**: path refers to a directory and the access requested involved writing
- **ETXTBSY**: path refers to an executable image which is currently being executed and write access was requested
- **EFAULT**: path points outside your accessible address space
- **EACCES**: The requested access to the file is not allowed, or one of the directories in path did not allow search (execute) permission.
- **ENAMETOOLONG**: path was too long.
- **ENOENT**: A directory component in path does not exist or is a dangling symbolic link.
- **ENOTDIR**: A component used as a directory in path is not, in fact, a directory.
- **EMFILE**: The process already has the maximum number of files open.
- **ENFILE**: The limit on the total number of files open on the system has been reached.
- **ENOMEM**: Insufficient kernel memory was available.
- **EROFS**: path refers to a file on a read-only filesystem and write access was requested

DESCRIPTION:

creat attempts to create a file and return a file descriptor for use in read, write, etc.
NOTES:

NONE

The routine is implemented in Cygnus newlib.
4.4.12 umask - Sets a file creation mask.

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>

mode_t umask(
    mode_t cmask
);
```

STATUS CODES:

DESCRIPTION:

The `umask()` function sets the process file creation mask to `cmask`. The file creation mask is used during `open()`, `creat()`, `mkdir()`, `mkfifo()` calls to turn off permission bits in the `mode` argument. Bit positions that are set in `cmask` are cleared in the mode of the created file.

NOTES:

NONE

The `cmask` argument should have only permission bits set. All other bits should be zero.

In a system which supports multiple processes, the file creation mask is inherited across `fork()` and `exec()` calls. This makes it possible to alter the default permission bits of created files. RTEMS does not support multiple processes so this behavior is not possible.
4.4.13 link - Creates a link to a file

CALLING SEQUENCE:

```c
#include <unistd.h>

int link(
    const char *existing,
    const char *new
);
```

STATUS CODES:

- **EACCES**  
  Search permission is denied for a directory in a file’s path prefix
- **EEXIST**  
  The named file already exists.
- **EMLINK**  
  The number of links would exceed `LINK_MAX`.  
- **ENAMETOOLONG**  
  Length of a filename string exceeds `PATH_MAX` and `POSIX_NO_TRUNC` is in effect.
- **ENOENT**  
  A file or directory does not exist.
- **ENOSPC**  
  No space left on disk.
- **ENOTDIR**  
  A component of the specified pathname was not a directory when a directory was expected.
- **EPERM**  
  Operation is not permitted. Process does not have the appropriate privileges or permissions to perform the requested operations.
- **EROFS**  
  Read-only file system.
- **EXDEV**  
  Attempt to link a file to another file system.

DESCRIPTION:

The `link()` function atomically creates a new link for an existing file and increments the link count for the file.

If the `link()` function fails, no directories are modified.

The `existing` argument should not be a directory.

The caller may (or may not) need permission to access the existing file.

NOTES:

NONE
4.4.14 symlink - Creates a symbolic link to a file

CALLING SEQUENCE:

```c
#include <unistd.h>

int symlink(
    const char *topath,
    const char *frompath
);
```

STATUS CODES:

- **EACCES** Search permission is denied for a directory in a file’s path prefix
- **EEXIST** The named file already exists.
- **ENAMETOOLONG** Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT** A file or directory does not exist.
- **ENOSPC** No space left on disk.
- **ENOTDIR** A component of the specified pathname was not a directory when a directory was expected.
- **EPERM** Operation is not permitted. Process does not have the appropriate privileges or permissions to perform the requested operations.
- **EROFS** Read-only file system.

DESCRIPTION:

The `symlink()` function creates a symbolic link from the frombath to the topath. The symbolic link will be interpreted at run-time.

If the `symlink()` function fails, no directories are modified.

The caller may (or may not) need permission to access the existing file.

NOTES:

NONE
4.4.15 readlink - Obtain the name of a symbolic link destination

CALLING SEQUENCE:

```c
#include <unistd.h>

int readlink(
    const char *path,
    char     *buf,
    size_t   bufsize
);
```

STATUS CODES:

- **EACCES**  
  Search permission is denied for a directory in a file’s path prefix

- **ENAMETOOLONG**  
  Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.

- **ENOENT**  
  A file or directory does not exist.

- **ENOTDIR**  
  A component of the prefix pathname was not a directory when a directory was expected.

- **ELOOP**  
  Too many symbolic links were encountered in the pathname.

- **EINVAL**  
  The pathname does not refer to a symbolic link

- **EFAULT**  
  An invalid pointer was passed into the readlink() routine.

DESCRIPTION:

The `readlink()` function places the symbolic link destination into `buf` argument and returns the number of characters copied.

If the symbolic link destination is longer than bufsize characters the name will be truncated.

NOTES:

NONE
4.4.16 mkdir - Makes a directory

CALLING SEQUENCE:

```
#include <sys/types.h>
#include <sys/stat.h>

int mkdir(
    const char *path,
    mode_t mode
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **EEXIST**: The name file already exist.
- **EMLINK**: The number of links would exceed LINK_MAX.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOSPC**: No space left on disk.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.
- **EROFS**: Read-only file system.

DESCRIPTION:

The `mkdir()` function creates a new directory named `path`. The permission bits (modified by the file creation mask) are set from `mode`. The owner and group IDs for the directory are set from the effective user ID and group ID.

The new directory may (or may not) contain entries for.. and .. but is otherwise empty.

NOTES:

NONE
4.4.17 mkfifo - Makes a FIFO special file

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>

int mkfifo(
    const char *path,
    mode_t mode
);
```

STATUS CODES:

- **EACCES**
  - Search permission is denied for a directory in a file’s path prefix
- **EEXIST**
  - The named file already exists.
- **ENOENT**
  - A file or directory does not exist.
- **ENOSPC**
  - No space left on disk.
- **ENOTDIR**
  - A component of the specified `path` was not a directory when a directory was expected.
- **EROFS**
  - Read-only file system.

DESCRIPTION:

The `mkfifo()` function creates a new FIFO special file named `path`. The permission bits (modified by the file creation mask) are set from `mode`. The owner and group IDs for the FIFO are set from the effective user ID and group ID.

NOTES:

NONE
4.4.18 unlink - Removes a directory entry

CALLING SEQUENCE:

```c
#include <unistd.h>

int unlink(
    const char path
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **EBUSY**: The directory is in use.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOTDIR**: A component of the specified path was not a directory when a directory was expected.
- **EPERM**: Operation is not permitted. Process does not have the appropriate privileges or permissions to perform the requested operations.
- **EROFS**: Read-only file system.

DESCRIPTION:

The `unlink` function removes the link named by `path` and decrements the link count of the file referenced by the link. When the link count goes to zero and no process has the file open, the space occupied by the file is freed and the file is no longer accessible.

NOTES:

NONE
4.4.19 rmdir - Delete a directory

CALLING SEQUENCE:

```c
#include <unistd.h>

int rmdir(
    const char *pathname
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>

DESCRIPTION:

`rmdir` deletes a directory, which must be empty
NOTES:

NONE
4.4.20 rename - Renames a file

CALLING SEQUENCE:

```c
#include <unistd.h>

int rename(
    const char *old,
    const char *new
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **EBUSY**: The directory is in use.
- **EEXIST**: The named file already exists.
- **EINVAL**: Invalid argument.
- **EISDIR**: Attempt to open a directory for writing or to rename a file to be a directory.
- **EMLINK**: The number of links would exceed LINK_MAX.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOSPC**: No space left on disk.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.
- **ENOTEMPTY**: Attempt to delete or rename a non-empty directory.
- **EROFS**: Read-only file system
- **EXDEV**: Attempt to link a file to another file system.

DESCRIPTION:

The `rename()` function causes the file known by `old` to now be known as `new`.

Ordinary files may be renamed to ordinary files, and directories may be renamed to directories; however, files cannot be converted using `rename()`. The `new` pathname may not contain a path prefix of `old`. 
NOTES:

If a file already exists by the name new, it is removed. The rename() function is atomic. If the rename() detects an error, no files are removed. This guarantees that the rename("x", "x") does not remove x.

You may not rename dot or dot-dot.

The routine is implemented in Cygnus newlib using link() and unlink().
4.4.21 stat - Gets information about a file

CALLING SEQUENCE:

```
#include <sys/types.h>
#include <sys/stat.h>

int stat(
    const char *path,
    struct stat *buf
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **EBADF**: Invalid file descriptor.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.

DESCRIPTION:

The `path` argument points to a pathname for a file. Read, write, or execute permission for the file is not required, but all directories listed in `path` must be searchable. The `stat()` function obtains information about the named file and writes it to the area pointed to by `buf`.

NOTES:

NONE
4.4.22 fstat - Gets file status

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>

int fstat(
    int fildes,
    struct stat *buf
);
```

STATUS CODES:

- EBADF        Invalid file descriptor

DESCRIPTION:

The `fstat()` function obtains information about the file associated with `fildes` and writes it to the area pointed to by the `buf` argument.

NOTES:

If the filesystem object referred to by `fildes` is a link, then the information returned in `buf` refers to the destination of that link. This is in contrast to `lstat()` which does not follow the link.
4.4.23 lstat - Gets file status

CALLING SEQUENCE:

```
#include <sys/types.h>
#include <sys/stat.h>

int lstat(
    int fildes,
    struct stat *buf
);
```

STATUS CODES:

EBADF  Invalid file descriptor

DESCRIPTION:

The lstat() function obtains information about the file associated with fildes and writes it to the area pointed to by the buf argument.

NOTES:

If the filesystem object referred to by fildes is a link, then the information returned in buf refers to the link itself. This is in contrast to fstat() which follows the link.

The lstat() routine is defined by BSD 4.3 and SVR4 and not included in POSIX 1003.1b-1996.
4.4.24 access - Check permissions for a file

CALLING SEQUENCE:

```c
#include <unistd.h>

int access(
    const char *pathname,
    int mode
);
```

STATUS CODES:

- **EACCES** The requested access would be denied, either to the file itself or one of the directories in `pathname`.
- **EFAULT** `pathname` points outside your accessible address space.
- **EINVAL** `Mode` was incorrectly specified.
- **ENAMETOOLONG** `pathname` is too long.
- **ENOENT** A directory component in `pathname` would have been accessible but does not exist or was a dangling symbolic link.
- **ENOTDIR** A component used as a directory in `pathname` is not, in fact, a directory.
- **ENOMEM** Insufficient kernel memory was available.

DESCRIPTION:

Access checks whether the process would be allowed to read, write or test for existence of the file (or other file system object) whose name is `pathname`. If `pathname` is a symbolic link permissions of the file referred by this symbolic link are tested.

`Mode` is a mask consisting of one or more of `R_OK`, `W_OK`, `X_OK` and `F_OK`.

NOTES:

NONE
4.4.25 chmod - Changes file mode.

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>

int chmod(
    const char *path,
    mode_t mode
);
```

STATUS CODES:

- **EACCES**: Search permission is denied for a directory in a file’s path prefix.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.
- **EPERM**: Operation is not permitted. Process does not have the appropriate privileges or permissions to perform the requested operations.
- **EROFS**: Read-only file system.

DESCRIPTION:

Set the file permission bits, the set user ID bit, and the set group ID bit for the file named by `path` to `mode`. If the effective user ID does not match the owner of the file and the calling process does not have the appropriate privileges, `chmod()` returns -1 and sets `errno` to `EPERM`.

NOTES:

NONE
4.4.26 chmod - Changes permissions of a file

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <sys/stat.h>

int chmod(
    int fildes,
    mode_t mode
);
```

STATUS CODES:

- **EACCES** Search permission is denied for a directory in a file’s path prefix.
- **EBADF** The descriptor is not valid.
- **EFAULT** `path` points outside your accessible address space.
- **EIO** A low-level I/O error occurred while modifying the inode.
- **ELOOP** `path` contains a circular reference.
- **ENAMETOOLONG** Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.
- **ENOENT** A file or directory does not exist.
- **ENOMEM** Insufficient kernel memory was available.
- **ENOTDIR** A component of the specified pathname was not a directory when a directory was expected.
- **EPERM** The effective UID does not match the owner of the file, and is not zero.
- **EROFS** Read-only file system.

DESCRIPTION:

The mode of the file given by `path` or referenced by `filedes` is changed.

NOTES:

NONE
4.4.27 getdents - Get directory entries

CALLING SEQUENCE:

```
#include <unistd.h>
#include <linux/dirent.h>
#include <linux/unistd.h>

long getdents(
    int dd_fd,
    char *dd_buf,
    int dd_len
);
```

STATUS CODES:

A successful call to getdents returns the number of bytes read. On end of directory, 0 is returned. When an error occurs, -1 is returned, and errno is set appropriately.

- EBADF: Invalid file descriptor fd.
-EFAULT: Argument points outside the calling process’s address space.
-EINVAL: Result buffer is too small.
-ENOENT: No such directory.
-ENOTDIR: File descriptor does not refer to a directory.

DESCRIPTION:

getdents reads several dirent structures from the directory pointed by fd into the memory area pointed to by dirp. The parameter count is the size of the memory area.

NOTES:

NONE
4.4.28 chown - Changes the owner and/or group of a file.

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <unistd.h>

int chown(
    const char *path,
    uid_t owner,
    gid_t group
);
```

STATUS CODES:

- **EACCESS**: Search permission is denied for a directory in a file’s path prefix.
- **EINVAL**: Invalid argument.
- **ENAMETOOLONG**: Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.
- **ENOENT**: A file or directory does not exist.
- **ENOTDIR**: A component of the specified pathname was not a directory when a directory was expected.
- **EPERM**: Operation is not permitted. Process does not have the appropriate privileges or permissions to perform the requested operations.
- **EROFS**: Read-only file system.

DESCRIPTION:

The user ID and group ID of the file named by `path` are set to `owner` and `path`, respectively. For regular files, the set group ID (S_ISGID) and set user ID (S_ISUID) bits are cleared.

Some systems consider it a security violation to allow the owner of a file to be changed. If users are billed for disk space usage, loaning a file to another user could result in incorrect billing. The `chown()` function may be restricted to privileged users for some or all files. The group ID can still be changed to one of the supplementary group IDs.

NOTES:

This function may be restricted for some file. The `pathconf` function can be used to test the `_PC_CHOWN_RESTRICTED` flag.
4.4.29 utime - Change access and/or modification times of an inode

CALLING SEQUENCE:

```c
#include <sys/types.h>

int utime(
    const char *filename,
    struct utimbuf *buf
);
```

STATUS CODES:

- **EACCES**  
  Permission to write the file is denied
- **ENOENT**  
  Filename does not exist

DESCRIPTION:

Utime changes the access and modification times of the inode specified by `filename` to the `actime` and `modtime` fields of `buf` respectively. If `buf` is NULL, then the access and modification times of the file are set to the current time.

NOTES:

NONE
4.4.30 ftruncate - truncate a file to a specified length

CALLING SEQUENCE:

```c
#include <unistd.h>

int ftruncate(
    int fd,
    size_t length
);
```

STATUS CODES:

- ENOTDIR: A component of the path prefix is not a directory.
- EINVAL: The pathname contains a character with the high-order bit set.
- ENAMETOOLONG: A component of a pathname exceeded 255 characters, or an entire path name exceeded 1023 characters.
- ENOENT: The named file does not exist.
- EACCES: The named file is not writable by the user.
- EACCES: Search permission is denied for a component of the path prefix.
- ELOOP: Too many symbolic links were encountered in translating the path name.
- EISDIR: The named file is a directory.
- EROFS: The named file resides on a read-only file system.
- ETXTBSY: The file is a pure procedure (shared text) file that is being executed.
- EIO: An I/O error occurred updating the inode.
-EFAULT: Path points outside the process’s allocated address space.
-EBADF: The fd is not a valid descriptor.

DESCRIPTION:

`truncate()` causes the file named by `path` or referenced by `fd` to be truncated to at most `length` bytes in size. If the file previously was larger than this size, the extra data is lost. With `ftruncate()`, the file must be open for writing.

NOTES:

NONE
4.4.31 truncate - truncate a file to a specified length

CALLING SEQUENCE:

```c
#include <unistd.h>

int truncate(
    const char *path,
    size_t length
);
```

STATUS CODES:

- **ENOTDIR**: A component of the path prefix is not a directory.
- **EINVAL**: The pathname contains a character with the high-order bit set.
- **ENAMETOOLONG**: A component of a pathname exceeded 255 characters, or an entire path name exceeded 1023 characters.
- **ENOENT**: The named file does not exist.
- **EACCES**: The named file is not writable by the user.
- **ELOOP**: Search permission is denied for a component of the path prefix.
- **EISDIR**: The named file is a directory.
- **EROFS**: The named file resides on a read-only file system.
- **ETXTBSY**: The file is a pure procedure (shared text) file that is being executed.
- **EIO**: An I/O error occurred updating the inode.
- **EFAULT**: The path points outside the process’s allocated address space.
- **EBADF**: The `fd` is not a valid descriptor.

DESCRIPTION:

The `truncate()` function causes the file named by `path` or referenced by `fd` to be truncated to at most `length` bytes in size. If the file previously was larger than this size, the extra data is lost. With `ftruncate()`, the file must be open for writing.

NOTES:

NONE
4.4.32 pathconf - Gets configuration values for files

CALLING SEQUENCE:

```
#include <unistd.h>

int pathconf(
    const char *path,
    int name
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid argument</td>
</tr>
<tr>
<td>EACCES</td>
<td>Permission to write the file is denied</td>
</tr>
<tr>
<td>ENAMETOOLONG</td>
<td>Length of a filename string exceeds PATH_MAX and _POSIX_NO_TRUNC is in effect.</td>
</tr>
<tr>
<td>ENOENT</td>
<td>A file or directory does not exist</td>
</tr>
<tr>
<td>ENOTDIR</td>
<td>A component of the specified path was not a directory when a directory was expected.</td>
</tr>
</tbody>
</table>

DESCRIPTION:

`pathconf()` gets a value for the configuration option `name` for the open file descriptor `filedes`.

The possible values for `name` are:

- `_PC_LINK_MAX` returns the maximum number of links to the file. If `filedes` or `path` refer to a directory, then the value applies to the whole directory. The corresponding macro is `_POSIX_LINK_MAX`.
- `_PC_MAX_CANON` returns the maximum length of a formatted input line, where `filedes` or `path` must refer to a terminal. The corresponding macro is `_POSIX_MAX_CANON`.
- `_PC_MAX_INPUT` returns the maximum length of an input line, where `filedes` or `path` must refer to a terminal. The corresponding macro is `_POSIX_MAX_INPUT`.
- `_PC_NAME_MAX` returns the maximum length of a filename in the directory `path` or `filedes`. The process is allowed to create. The corresponding macro is `_POSIX_NAME_MAX`.
- `_PC_PATH_MAX` returns the maximum length of a relative pathname when `path` or `filedes` is the current working directory. The corresponding macro is `_POSIX_PATH_MAX`.
returns the size of the pipe buffer, where `filedes` must refer to a pipe or FIFO and `path` must refer to a FIFO. The corresponding macro is `_POSIX_PIPE_BUF`.

rets nonzero if the chown(2) call may not be used on this file. If `filedes` or `path` refer to a directory, then this applies to all files in that directory. The corresponding macro is `_POSIX_CHOWN_RESTRICTED`.

NOTES:

Files with name lengths longer than the value returned for `name` equal `_PC_NAME_MAX` may exist in the given directory.
4.4.33 fpathconf - Gets configuration values for files

CALLING SEQUENCE:

```c
#include <unistd.h>

int fpathconf(
    int filedes,
    int name
);
```

STATUS CODES:

```
EINVAL          Invalid argument
EACCES          Permission to write the file is denied
ENAMETOOLONG    Length of a filename string exceeds PATH_MAX and
                _POSIX_NO_TRUNC is in effect.
ENOENT           A file or directory does not exist
ENOTDIR         A component of the specified path was not a directory when a directory was expected.
```

DESCRIPTION:

`fpathconf()` gets a value for the configuration option `name` for the open file descriptor `filedes`.

The possible values for `name` are:

```
_PC_LINK_MAX       returns the maximum number of links to the file. If `filedes` or `path` refer to a directory, then the value applies to the whole directory. The corresponding macro is _POSIX_LINK_MAX.
_PC_MAX_CANON     returns the maximum length of a formatted input line, where `filedes` or `path` must refer to a terminal. The corresponding macro is _POSIX_MAX_CANON.
_PC_MAX_INPUT     returns the maximum length of an input line, where `filedes` or `path` must refer to a terminal. The corresponding macro is _POSIX_MAX_INPUT.
_PC_NAME_MAX      returns the maximum length of a filename in the directory `path` or `filedes`. The process is allowed to create. The corresponding macro is _POSIX_NAME_MAX.
```
returns the maximum length of a relative pathname when \texttt{path} or \texttt{filedes} is the current working directory. The corresponding macro is \_POSIX\_PATH\_MAX.

\texttt{PC\_PIPE\_BUF} returns the size of the pipe buffer, where \texttt{filedes} must refer to a pipe or FIFO and \texttt{path} must refer to a FIFO. The corresponding macro is \_POSIX\_PIPE\_BUF.

\texttt{PC\_CHOWN\_RESTRICTED} returns nonzero if the \texttt{chown()} call may not be used on this file. If \texttt{filedes} or \texttt{path} refer to a directory, then this applies to all files in that directory. The corresponding macro is \_POSIX\_CHOWN\_RESTRICTED.

\textbf{NOTES:}

NONE
4.4.34 mknod - create a directory

CALLING SEQUENCE:

```c
#include <unistd.h>
#include <fcntl.h>
#include <sys/types.h>
#include <sys/stat.h>

long mknod(
    const char *pathname,
    mode_t mode,
    dev_t dev
);
```

STATUS CODES:

mknod returns zero on success, or -1 if an error occurred (in which case, errno is set appropriately).

ENAMETOOLONG pathname was too long.
ENOENT A directory component in pathname does not exist or is a dangling symbolic link.
ENOTDIR A component used in the directory pathname is not, in fact, a directory.
ENOMEM Insufficient kernel memory was available
EROFS pathname refers to a file on a read-only filesystem.
ELOOP pathname contains a reference to a circular symbolic link, ie a symbolic link whose expansion contains a reference to itself.
ENOSPC The device containing pathname has no room for the new node.

DESCRIPTION:

mknod attempts to create a filesystem node (file, device special file or named pipe) named pathname, specified by mode and dev.

mode specifies both the permissions to use and the type of node to be created.

It should be a combination (using bitwise OR) of one of the file types listed below and the permissions for the new node.

The permissions are modified by the process’s umask in the usual way: the permissions of the created node are (mode & ~umask).
The file type should be one of \texttt{S\_IFREG}, \texttt{S\_IFCHR}, \texttt{S\_IFBLK} and \texttt{S\_IFIFO} to specify a normal file (which will be created empty), character special file, block special file or FIFO (named pipe), respectively, or zero, which will create a normal file.

If the file type is \texttt{S\_IFCHR} or \texttt{S\_IFBLK} then \texttt{dev} specifies the major and minor numbers of the newly created device special file; otherwise it is ignored.

The newly created node will be owned by the effective uid of the process. If the directory containing the node has the set group id bit set, or if the filesystem is mounted with BSD group semantics, the new node will inherit the group ownership from its parent directory; otherwise it will be owned by the effective gid of the process.

\textbf{NOTES:}

NONE
5 Input and Output Primitives Manager

5.1 Introduction

The input and output primitives manager is ...

The directives provided by the input and output primitives manager are:

- `pipe` - Create an Inter-Process Channel
- `dup` - Duplicates an open file descriptor
- `dup2` - Duplicates an open file descriptor
- `close` - Closes a file
- `read` - Reads from a file
- `write` - Writes to a file
- `fcntl` - Manipulates an open file descriptor
- `lseek` - Reposition read/write file offset
- `fsync` - Synchronize file complete in-core state with that on disk
- `fdatasync` - Synchronize file in-core data with that on disk
- `mount` - Mount a file system
- `unmount` - Unmount file systems
- `aio_read` - Asynchronous Read
- `aio_write` - Asynchronous Write
- `lio_listio` - List Directed I/O
- `aio_error` - Retrieve Error Status of Asynchronous I/O Operation
- `aio_return` - Retrieve Return Status Asynchronous I/O Operation
- `aio_cancel` - Cancel Asynchronous I/O Request
- `aio_suspend` - Wait for Asynchronous I/O Request
- `aio_fsync` - Asynchronous File Synchronization

5.2 Background

There is currently no text in this section.

5.3 Operations

There is currently no text in this section.
5.4 Directives

This section details the input and output primitives manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
5.4.1 pipe - Create an Inter-Process Channel

CALLING SEQUENCE:

    int pipe(
    );

STATUS CODES:

E          The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
5.4.2 dup - Duplicates an open file descriptor

CALLING SEQUENCE:

```c
#include <unistd.h>

int dup(
    int fildes
);
```

STATUS CODES:

- **EBADF**: Invalid file descriptor.
- **EINTR**: Function was interrupted by a signal.
- **EMFILE**: The process already has the maximum number of file descriptors open and tried to open a new one.

DESCRIPTION:

The `dup` function returns the lowest numbered available file descriptor. This new descriptor refers to the same open file as the original descriptor and shares any locks.

NOTES:

NONE
5.4.3 dup2 - Duplicates an open file descriptor

CALLING SEQUENCE:

```
#include <unistd.h>

int dup2(
    int fildes,
    int fildes2
);
```

STATUS CODES:

- **EBADF**  Invalid file descriptor.
- **EINTR**  Function was interrupted by a signal.
- **EMFILE** The process already has the maximum number of file descriptors open and tried to open a new one.

DESCRIPTION:

Dup2 creates a copy of the file descriptor `oldfd`.

The old and new descriptors may be used interchangeably. They share locks, file position pointers and flags; for example, if the file position is modified by using `lseek` on one of the descriptors, the position is also changed for the other.

NOTES:

NONE
5.4.4 close - Closes a file.

CALLING SEQUENCE:

```c
#include <unistd.h>

int close(
    int fildes
);
```

STATUS CODES:

- **EBADF**: Invalid file descriptor
- **EINTR**: Function was interrupted by a signal.

DESCRIPTION:

The `close()` function deallocates the file descriptor named by `fildes` and makes it available for reuse. All outstanding record locks owned by this process for the file are unlocked.

NOTES:

A signal can interrupt the `close()` function. In that case, `close()` returns -1 with `errno` set to EINTR. The file may or may not be closed.
5.4.5 read - Reads from a file.

CALLING SEQUENCE:

```c
#include <unistd.h>

int read(
    int fildes,
    void* buf,
    unsigned int nbyte
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` to one of the following:

- **EAGAIN**: The O_NONBLOCK flag is set for a file descriptor and the process would be delayed in the I/O operation.
- **EBADF**: Invalid file descriptor.
- **EINTR**: Function was interrupted by a signal.
- **EIO**: Input or output error.

DESCRIPTION:

The `read()` function reads `nbyte` bytes from the file associated with `fildes` into the buffer pointed to by `buf`.

The `read()` function returns the number of bytes actually read and placed in the buffer. This will be less than `nbyte` if:

- The number of bytes left in the file is less than `nbyte`.
- The `read()` request was interrupted by a signal.
- The file is a pipe or FIFO or special file with less than `nbytes` immediately available for reading.

When attempting to read from any empty pipe or FIFO:

- If no process has the pipe open for writing, zero is returned to indicate end-of-file.
- If some process has the pipe open for writing and O_NONBLOCK is set, -1 is returned and `errno` is set to EAGAIN.
- If some process has the pipe open for writing and O_NONBLOCK is clear, `read()` waits for some data to be written or the pipe to be closed.

When attempting to read from a file other than a pipe or FIFO and no data is available.
• If O_NONBLOCK is set, -1 is returned and *errno* is set to EAGAIN.
• If O_NONBLOCK is clear, *read()* waits for some data to become available.
• The O_NONBLOCK flag is ignored if data is available.

NOTES:

NONE
5.4.6 write - Writes to a file

CALLING SEQUENCE:

```
#include <unistd.h>

int write(
    int fildes,
    const void *buf,
    unsigned int nbytes
);
```

STATUS CODES:

- **EAGAIN**: The O_NONBLOCK flag is set for a file descriptor and the process would be delayed in the I/O operation.
- **EBADF**: Invalid file descriptor
- **EFBIG**: An attempt was made to write to a file that exceeds the maximum file size
- **EINVAL**: The function was interrupted by a signal.
- **EIO**: Input or output error.
- **ENOSPC**: No space left on disk.
- **EPIPE**: Attempt to write to a pipe or FIFO with no reader.

DESCRIPTION:

The `write()` function writes `nbyte` from the array pointed to by `buf` into the file associated with `fildes`.

If `nbyte` is zero and the file is a regular file, the `write()` function returns zero and has no other effect. If `nbyte` is zero and the file is a special file, the results are not portable.

The `write()` function returns the number of bytes written. This number will be less than `nbytes` if there is an error. It will never be greater than `nbytes`.

NOTES:

NONE
5.4.7 fcntl - Manipulates an open file descriptor

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <fcntl.h>
#include <unistd.h>

int fcntl(
    int fildes,
    int cmd
);
```

STATUS CODES:

- **EACCESS**: Search permission is denied for a directory in a file’s path prefix.
- **EAGAIN**: The O_NONBLOCK flag is set for a file descriptor and the process would be delayed in the I/O operation.
- **EBADF**: Invalid file descriptor
- **EDEADLK**: An `fcntl` with function `F_SETLKW` would cause a deadlock.
- **EINVAL**: Invalid argument
- **EMFILE**: Too many file descriptor or in use by the process.
- **ENOLCK**: No locks available

DESCRIPTION:

`fcntl()` performs one of various miscellaneous operations on `fd`. The operation in question is determined by `cmd`:

- **F_DUPFD**: Makes `arg` be a copy of `fd`, closing `fd` first if necessary. The same functionality can be more easily achieved by using `dup2()`. The old and new descriptors may be used interchangeably. They share locks, file position pointers and flags; for example, if the file position is modified by using `lseek()` on one of the descriptors, the position is also changed for the other. The two descriptors do not share the close-on-exec flag, however. The close-on-exec flag of the copy is off, meaning that it will be closed on exec. On success, the new descriptor is returned.
F_GETFD Read the close-on-exec flag. If the low-order bit is 0, the file will remain open across exec, otherwise it will be closed.

F_SETFD Set the close-on-exec flag to the value specified by arg (only the least significant bit is used).

F_GETFL Read the descriptor’s flags (all flags (as set by open()) are returned).

F_SETFL Set the descriptor’s flags to the value specified by arg. Only \_O_APPEND and \_O_NONBLOCK may be set.

The flags are shared between copies (made with dup() etc.) of the same file descriptor.

The flags and their semantics are described in open().

F_GETLK, F_SETLK and F_SETLKW
Manage discretionary file locks. The third argument arg is a pointer to a struct flock (that may be overwritten by this call).

F_GETLK Return the flock structure that prevents us from obtaining the lock, or set the l\_type field of the lock to F\_UNLCK if there is no obstruction.

F_SETLK The lock is set (when l\_type is F\_RDLCK or F\_WRLCK) or cleared (when it is F\_UNLCK). If lock is held by someone else, this call returns -1 and sets errno to EACCES or EAGAIN.

F_SETLKW Like F_SETLK, but instead of returning an error we wait for the lock to be released.

F_GETOWN Get the process ID (or process group) of the owner of a socket.
Process groups are returned as negative values.

F_SETOWN Set the process or process group that owns a socket.
For these commands, ownership means receiving SIGIO or SIGURG signals.
Process groups are specified using negative values.

NOTES:

The errors returned by dup2 are different from those returned by F\_DUPFD.
5.4.8 lseek - Reposition read/write file offset

CALLING SEQUENCE:

```c
#include <sys/types.h>
#include <unistd.h>

int lseek(
    int fildes,
    off_t offset,
    int whence
);
```

STATUS CODES:

- **EBADF**: `fildes` is not an open file descriptor.
- **ESPIPE**: `fildes` is associated with a pipe, socket or FIFO.
- **EINVAL**: `whence` is not a proper value.

DESCRIPTION:

The `lseek` function repositions the offset of the file descriptor `fildes` to the argument `offset` according to the directive `whence`. The argument `fildes` must be an open file descriptor. `lseek` repositions the file pointer `fildes` as follows:

- If `whence` is SEEK_SET, the offset is set to `offset` bytes.
- If `whence` is SEEK_CUR, the offset is set to its current location plus `offset` bytes.
- If `whence` is SEEK_END, the offset is set to the size of the file plus `offset` bytes.

The `lseek` function allows the file offset to be set beyond the end of the existing end-of-file of the file. If data is later written at this point, subsequent reads of the data in the gap return bytes of zeros (until data is actually written into the gap).

Some devices are incapable of seeking. The value of the pointer associated with such a device is undefined.

NOTES:

NONE
5.4.9 fsync - Synchronize file complete in-core state with that on disk

CALLING SEQUENCE:

```c
int fsync(
    int fd
);
```

STATUS CODES:

On success, zero is returned. On error, -1 is returned, and `errno` is set appropriately.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBADF</td>
<td><code>fd</code> is not a valid descriptor open for writing</td>
</tr>
<tr>
<td>EINVAL</td>
<td><code>fd</code> is bound to a special file which does not support synchronization</td>
</tr>
<tr>
<td>EROFS</td>
<td><code>fd</code> is bound to a special file which does not support synchronization</td>
</tr>
<tr>
<td>EIO</td>
<td>An error occurred during synchronization</td>
</tr>
</tbody>
</table>

DESCRIPTION:

`fsync` copies all in-core parts of a file to disk.

NOTES:

NONE
5.4.10 fdatasync - Synchronize file in-core data with that on disk.

CALLING SEQUENCE:

    int fdatasync(
        int fd
    );

STATUS CODES:

On success, zero is returned. On error, -1 is returned, and errno is set appropriately.

- EBADF    fd is not a valid file descriptor open for writing.
- EINVAL   fd is bound to a special file which does not support synchronization.
- EIO       An error occurred during synchronization.
- EROFS    fd is bound to a special file which does not support synchronization.

DESCRIPTION:

fdatasync flushes all data buffers of a file to disk (before the system call returns). It
resembles fsync but is not required to update the metadata such as access time.

Applications that access databases or log files often write a tiny data fragment (e.g., one
line in a log file) and then call fsync immediately in order to ensure that the written
data is physically stored on the harddisk. Unfortunately, fsync will always initiate two
write operations: one for the newly written data and another one in order to update the
modification time stored in the inode. If the modification time is not a part of the transaction
concept fdatasync can be used to avoid unnecessary inode disk write operations.

NOTES:

NONE
5.4.11 mount - Mount a file system

**CALLING SEQUENCE:**

```c
#include <libio.h>

int mount(
    rtems_filesystem_mount_table_entry_t **mt_entry,
    rtems_filesystem_operations_table *fs_ops,
    rtems_filesystem_options_t fo,
    char *device,
    char *mount_point
);
```

**STATUS CODES:**

EXXX

**DESCRIPTION:**

The `mount` routines mounts the filesystem class which uses the filesystem operations specified by `fs_ops` and `fs_options`. The filesystem is mounted at the directory `mount_point` and the mode of the mounted filesystem is specified by `fs_options`. If this filesystem class requires a device, then the name of the device must be specified by `device`.

If this operation succeeds, the mount table entry for the mounted filesystem is returned in `mt_entry`.

**NOTES:**

NONE
5.4.12 unmount - Unmount file systems

CALLING SEQUENCE:

```
#include <libio.h>

int unmount(
    const char *mount_path
);
```

STATUS CODES:

EXXX

DESCRIPTION:

The `unmount` routine removes the attachment of the filesystem specified by `mount_path`.

NOTES:

NONE

```c
int aio_fsync(
);
```

**STATUS CODES:**

E The

**DESCRIPTION:**

This routine is not currently supported by RTEMS but could be in a future version.
6 Device- and Class- Specific Functions Manager

6.1 Introduction

The device- and class- specific functions manager is ...

The directives provided by the device- and class- specific functions manager are:

- `cfgetispeed` - Reads terminal input baud rate
- `cfgetospeed` - Reads terminal output baud rate
- `cfsetispeed` - Sets terminal input baud rate
- `cfsetospeed` - Set terminal output baud rate
- `tcgetattr` - Gets terminal attributes
- `tcsetattr` - Set terminal attributes
- `tcsendbreak` - Sends a break to a terminal
- `tcdrain` - Waits for all output to be transmitted to the terminal
- `tcflush` - Discards terminal data
- `tcflow` - Suspends/restarts terminal output
- `tcgetpgrp` - Gets foreground process group ID
- `tcsetpgrp` - Sets foreground process group ID

6.2 Background

There is currently no text in this section.

6.3 Operations

There is currently no text in this section.

6.4 Directives

This section details the device- and class- specific functions manager’s directives. A sub-section is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
6.4.1 cfgetispeed - Reads terminal input baud rate

CALLING SEQUENCE:

```c
#include <termios.h>

int cfgetispeed(
    const struct termios *p
);
```

STATUS CODES:

The `cfgetispeed()` function returns a code for baud rate.

DESCRIPTION:

The `cfsetispeed()` function stores a code for the terminal speed stored in a struct termios. The codes are defined in `<termios.h>` by the macros BO, B50, B75, B110, B134, B150, B200, B300, B600, B1200, B1800, B2400, B4800, B9600, B19200, and B38400.

The `cfsetispeed()` function does not do anything to the hardware. It merely stores a value for use by `tcsetattr()`.

NOTES:

Baud rates are defined by symbols, such as B110, B1200, B2400. The actual number returned for any given speed may change from system to system.
6.4.2 cfgetospeed - Reads terminal output baud rate

CALLING SEQUENCE:

#include <termios.h>

int cfgetospeed(
  const struct termios *p
);

STATUS CODES:

The cfgetospeed() function returns the termios code for the baud rate.

DESCRIPTION:

The cfgetospeed() function returns a code for the terminal speed stored in a struct termios. The codes are defined in <termios.h> by the macros BO, B50, B75, B110, B134, B150, B200, B300, B600, B1200, B1800, B2400, B4800, B9600, B19200, and B38400.

The cfgetospeed() function does not do anything to the hardware. It merely returns the value stored by a previous call to tcgetattr().

NOTES:

Baud rates are defined by symbols, such as B110, B1200, B2400. The actual number returned for any given speed may change from system to system.
6.4.3 cfsetispeed - Sets terminal input baud rate

CALLING SEQUENCE:

```c
#include <termios.h>

int cfsetispeed(
    struct termios *p,
    speed_t speed
);
```

STATUS CODES:

The `cfsetispeed()` function returns a zero when successful and returns -1 when an error occurs.

DESCRIPTION:

The `cfsetispeed()` function stores a code for the terminal speed stored in a `struct termios`. The codes are defined in `<termios.h>` by the macros B0, B50, B75, B110, B134, B150, B200, B300, B600, B1200, B1800, B2400, B4800, B9600, B19200, and B38400.

NOTES:

This function merely stores a value in the `termios` structure. It does not change the terminal speed until a `tcsetattr()` is done. It does not detect impossible terminal speeds.
6.4.4 cfsetospeed - Sets terminal output baud rate

CALLING SEQUENCE:

```c
#include <termios.h>

int cfsetospeed(
    struct termios *p,
    speed_t speed
);
```

STATUS CODES:

The cfsetospeed() function returns a zero when successful and returns -1 when an error occurs.

DESCRIPTION:

The cfsetospeed() function stores a code for the terminal speed stored in a struct termios. The codes are defined in <termios.h> by the macros B0, B50, B75, B110, B134, B150, B200, B300, B600, B1200, B1800, B2400, B4800, B9600, B19200, and B38400.

The cfsetospeed() function does not do anything to the hardware. It merely stores a value for use by tcsetattr().

NOTES:

This function merely stores a value in the termios structure. It does not change the terminal speed until a tcsetattr() is done. It does not detect impossible terminal speeds.
6.4.5 tcgetattr - Gets terminal attributes

CALLING SEQUENCE:

```c
#include <termios.h>
#include <unistd.h>

int tcgetattr(
    int fildes,
    struct termios *p
);
```

STATUS CODES:

- EBADF: Invalid file descriptor
- ENOPTY: Terminal control function attempted for a file that is not a terminal.

DESCRIPTION:

The `tcgetattr()` gets the parameters associated with the terminal referred to by `fildes` and stores them into the `termios()` structure pointed to by `termios_p`.

NOTES:

NONE
6.4.6 tcsetattr - Set terminal attributes

CALLING SEQUENCE:

```
#include <termios.h>
#include <unistd.h>

int tcsetattr(
    int fildes, // file descriptor
    int options, // options for setting terminal attributes
    const struct termios *tp
);
```

STATUS CODES:

E The

DESCRIPTION:

NOTES:
6.4.7 tcsendbreak - Sends a break to a terminal

CALLING SEQUENCE:

    int tcsendbreak(
        int fd
    );

STATUS CODES:

E  The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
6.4.8 tcdrain - Waits for all output to be transmitted to the terminal.

CALLING SEQUENCE:

```c
#include <termios.h>
#include <unistd.h>

int tcdrain(
    int fildes
);
```

STATUS CODES:

- **EBADF** Invalid file descriptor
- **EINTR** Function was interrupted by a signal
- **ENOTTY** Terminal control function attempted for a file that is not a terminal.

DESCRIPTION:

The `tcdrain()` function waits until all output written to `fildes` has been transmitted.

NOTES:

NONE
6.4.9 tcflush - Discards terminal data

CALLING SEQUENCE:

```c
int tcflush(
    int fd
);
```

STATUS CODES:

E The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
6.4.10 tcflow - Suspends/restarts terminal output.

CALLING SEQUENCE:

```c
int tcflow(
    int fd
);
```

STATUS CODES:

E The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
6.4.11 tcgetpgrp - Gets foreground process group ID

CALLING SEQUENCE:

```c
int tcgetpgrp();
```

STATUS CODES:

E  The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
6.4.12 tcsetpgrp - Sets foreground process group ID

CALLING SEQUENCE:

```c
int tcsetpgrp(
    );
```

STATUS CODES:

E The

DESCRIPTION:

NOTES:

This routine is not currently supported by RTEMS but could be in a future version.
7 Language-Specific Services for the C Programming Language Manager

7.1 Introduction

The language-specific services for the C programming language manager is ...

The directives provided by the language-specific services for the C programming language manager are:

- setlocale - Set the Current Locale
- fileno - Obtain File Descriptor Number for this File
- fdopen - Associate Stream with File Descriptor
- flockfile - Acquire Ownership of File Stream
- ftrylockfile - Poll to Acquire Ownership of File Stream
- funlockfile - Release Ownership of File Stream
- getc_unlocked - Get Character without Locking
- getchar_unlocked - Get Character from stdin without Locking
- putc_unlocked - Put Character without Locking
- putchar_unlocked - Put Character to stdin without Locking
- setjmp - Save Context for Non-Local Goto
- longjmp - Non-Local Jump to a Saved Context
- sigsetjmp - Save Context with Signal Status for Non-Local Goto
- siglongjmp - Non-Local Jump with Signal Status to a Saved Context
- tzset - Initialize Time Conversion Information
- strtok_r - Reentrant Extract Token from String
- asctime_r - Reentrant struct tm to ASCII Time Conversion
- ctime_r - Reentrant time_t to ASCII Time Conversion
- gmtime_r - Reentrant UTC Time Conversion
- localtime_r - Reentrant Local Time Conversion
- rand_r - Reentrant Random Number Generation

DESCRIPTION:

NOTES:
9 Semaphore Manager

9.1 Introduction

The semaphore manager provides functions to allocate, delete, and control semaphores. This manager is based on the POSIX 1003.1 standard.

The directives provided by the semaphore manager are:

- `sem_init` - Initialize an unnamed semaphore
- `sem_destroy` - Destroy an unnamed semaphore
- `sem_open` - Open a named semaphore
- `sem_close` - Close a named semaphore
- `sem_unlink` - Remove a named semaphore
- `sem_wait` - Lock a semaphore
- `sem_trywait` - Lock a semaphore
- `sem_timedwait` - Wait on a Semaphore for a Specified Time
- `sem_post` - Unlock a semaphore
- `sem_getvalue` - Get the value of a semaphore

9.2 Background

9.2.1 Theory

Semaphores are used for synchronization and mutual exclusion by indicating the availability and number of resources. The task (the task which is returning resources) notifying other tasks of an event increases the number of resources held by the semaphore by one. The task (the task which will obtain resources) waiting for the event decreases the number of resources held by the semaphore by one. If the number of resources held by a semaphore is insufficient (namely 0), the task requiring resources will wait until the next time resources are returned to the semaphore. If there is more than one task waiting for a semaphore, the tasks will be placed in the queue.

9.2.2 "sem_t" Structure

The `sem_t` structure is used to represent semaphores. It is passed as an argument to the semaphore directives and is defined as follows:

```c
typedef int sem_t;
```

9.2.3 Building a Semaphore Attribute Set
9.3 Operations

9.3.1 Using as a Binary Semaphore

Although POSIX supports mutexes, they are only visible between threads. To work between processes, a binary semaphore must be used.

Creating a semaphore with a limit on the count of 1 effectively restricts the semaphore to being a binary semaphore. When the binary semaphore is available, the count is 1. When the binary semaphore is unavailable, the count is 0.

Since this does not result in a true binary semaphore, advanced binary features like the Priority Inheritance and Priority Ceiling Protocols are not available.

There is currently no text in this section.

9.4 Directives

This section details the semaphore manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
9.4.1 sem_init - Initialize an unnamed semaphore

CALLING SEQUENCE:

```c
int sem_init(
    sem_t *sem,
    int pshared,
    unsigned int value
);
```

STATUS CODES:

- **EINVAL** The value argument exceeds SEM_VALUE_MAX
- **ENOSPC** A resource required to initialize the semaphore has been exhausted
  - The limit on semaphores (SEM_VALUE_MAX) has been reached
- **ENOSYS** The function sem_init is not supported by this implementation
- **EPERM** The process lacks appropriate privileges to initialize the semaphore

DESCRIPTION:

The sem_init function is used to initialize the unnamed semaphore referred to by "sem". The value of the initialized semaphore is the parameter "value". The semaphore remains valid until it is destroyed.

ADD MORE HERE XXX

NOTES:

If the functions completes successfully, it shall return a value of zero. Otherwise, it shall return a value of -1 and set "errno" to specify the error that occurred.

Multiprocessing is currently not supported in this implementation.
9.4.2 sem_destroy - Destroy an unnamed semaphore

CALLING SEQUENCE:

```c
int sem_destroy(
    sem_t *sem
);
```

STATUS CODES:

- **EINVAL**: The value argument exceeds SEM_VALUE_MAX
- **ENOSYS**: The function sem_init is not supported by this implementation
- **EBUSY**: There are currently processes blocked on the semaphore

DESCRIPTION:

The sem_destroy function is used to destroy an unnamed semaphore refered to by "sem". sem_destroy can only be used on a semaphore that was created using sem_init.

NOTES:

If the functions completes successfully, it shall return a value of zero. Otherwise, it shall return a value of -1 and set "errno" to specify the error that occurred.

Multiprocessing is currently not supported in this implementation.
9.4.3 sem_open - Open a named semaphore

CALLING SEQUENCE:

```c
int sem_open(
    const char *name,
    int oflag
);
```

ARGUMENTS:

The following flag bit may be set in oflag:

- **O_CREAT** - Creates the semaphore if it does not already exist. If O_CREAT is set and the semaphore already exists then O_CREAT has no effect. Otherwise, sem_open() creates a semaphore. The O_CREAT flag requires the third and fourth argument: mode and value of type mode_t and unsigned int, respectively.

- **O_EXCL** - If O_EXCL and O_CREAT are set, all call to sem_open() shall fail if the semaphore name exists.

STATUS CODES:

- **EACCES**  
  Valid name specified but oflag permissions are denied, or the semaphore name specified does not exist and permission to create the named semaphore is denied.

- **EEXIST**  
  O_CREAT and O_EXCL are set and the named semaphore already exists.

- **EINTR**  
  The sem_open() operation was interrupted by a signal.

- **EINVAL**  
  The sem_open() operation is not supported for the given name.

- **EMFILE**  
  Too many semaphore descriptors or file descriptors in use by this process.

- **ENAMETOOLONG**  
  The length of the name exceed PATH_MAX or name component is longer than NAME_MAX while POSIX_NO_TRUNC is in effect.

- **ENOENT**  
  O_CREAT is not set and the named semaphore does not exist.

- **ENOSPC**  
  There is insufficient space for the creation of a new named semaphore.

- **ENOSYS**  
  The function sem_open() is not supported by this implementation.

DESCRIPTION:

The sem_open() function establishes a connection between a specified semaphore and a process. After a call to sem_open with a specified semaphore name, a process can reference
to semaphore by the associated name using the address returned by the call. The oflag
arguments listed above control the state of the semaphore by determining if the semaphore
is created or accessed by a call to sem_open().

NOTES:
9.4.4 sem_close - Close a named semaphore

**CALLING SEQUENCE:**

```c
int sem_close(
    sem_t *sem_close
);
```

**STATUS CODES:**

- **EACCES** The semaphore argument is not a valid semaphore descriptor.
- **ENOSYS** The function sem_close is not supported by this implementation.

**DESCRIPTION:**

The sem_close() function is used to indicate that the calling process is finished using the named semaphore indicated by sem. The function sem_close deallocates any system resources that were previously allocated by a sem_open system call. If sem_close() completes successfully it returns a 1, otherwise a value of -1 is return and errno is set.

**NOTES:**
9.4.5 sem_unlink - Unlink a semaphore

CALLING SEQUENCE:

```c
int sem_unlink(
    const char *name
);
```

STATUS CODES:

- **EACCESS**: Permission is denied to unlink a semaphore.
- **ENAMETOOLONG**: The length of the strong name exceed NAME_MAX while POSIX_NO_TRUNC is in effect.
- **ENOENT**: The name of the semaphore does not exist.
- **ENOSPC**: There is insufficient space for the creation of a new named semaphore.
- **ENOSYS**: The function sem_unlink is not supported by this implementation.

DESCRIPTION:

The `sem_unlink()` function shall remove the semaphore name by the string name. If a process is currently accessing the name semaphore, the sem_unlink command has no effect. If one or more processes have the semaphore open when the sem_unlink function is called, the destruction of semaphores shall be postponed until all reference to semaphore are destroyed by calls to `sem_close`, `_exit()`, or `exec`. After all references have been destroyed, it returns immediately.

If the termination is successful, the function shall return 0. Otherwise, a -1 is returned and the errno is set.

NOTES:
9.4.6 sem_wait - Wait on a Semaphore

CALLING SEQUENCE:

```c
int sem_wait(
    sem_t *sem
);
```

STATUS CODES:

EINVAL The "sem" argument does not refer to a valid semaphore

DESCRIPTION:

This function attempts to lock a semaphore specified by sem. If the semaphore is available, then the semaphore is locked (i.e., the semaphore value is decremented). If the semaphore is unavailable (i.e., the semaphore value is zero), then the function will block until the semaphore becomes available. It will then successfully lock the semaphore. The semaphore remains locked until released by a sem_post() call.

If the call is unsuccessful, then the function returns -1 and sets errno to the appropriate error code.

NOTES:

Multiprocessing is not supported in this implementation.
9.4.7  sem_trywait - Non-blocking Wait on a Semaphore

CALLING SEQUENCE:

    int sem_trywait(
        sem_t *sem
    );

STATUS CODES:

EAGAIN   The semaphore is not available (i.e., the semaphore value is zero), so the semaphore could not be locked.
EINVAL  The sem argument does not refer to a valid semaphore

DESCRIPTION:

This function attempts to lock a semaphore specified by sem. If the semaphore is available, then the semaphore is locked (i.e., the semaphore value is decremented) and the function returns a value of 0. The semaphore remains locked until released by a sem_post() call. If the semaphore is unavailable (i.e., the semaphore value is zero), then the function will return a value of -1 immediately and set errno to EAGAIN.

If the call is unsuccessful, then the function returns -1 and sets errno to the appropriate error code.

NOTES:

Multiprocessing is not supported in this implementation.
9.4.8 sem_timedwait - Wait on a Semaphore for a Specified Time

CALLING SEQUENCE:

```c
int sem_timedwait(
    sem_t *sem,
    const struct timespec *timeout
);
```

STATUS CODES:

- **EAGAIN**: The semaphore is not available (i.e., the semaphore value is zero), so the semaphore could not be locked.
- **EINVAL**: The `sem` argument does not refer to a valid semaphore.

DESCRIPTION:

This function attempts to lock a semaphore specified by `sem`, and will wait for the semaphore for an interval specified by `timeout`. If the semaphore is available, then the semaphore is locked (i.e., the semaphore value is decremented) and the function returns a value of 0. The semaphore remains locked until released by a `sem_post()` call. If the semaphore is unavailable, then the function will wait for the semaphore to become available for the amount of time specified by `timeout`.

If the semaphore does not become available within the interval specified by `timeout`, then the function returns -1 and sets `errno` to EAGAIN. If any other error occurs, the function returns -1 and sets `errno` to the appropriate error code.

NOTES:

Multiprocessing is not supported in this implementation.
9.4.9 sem_post - Unlock a Semaphore

CALLING SEQUENCE:

```c
int sem_post(
    sem_t *sem
);
```

STATUS CODES:

EINVAL The `sem` argument does not refer to a valid semaphore

DESCRIPTION:

This function attempts to release the semaphore specified by `sem`. If other tasks are waiting on the semaphore, then one of those tasks (which one depends on the scheduler being used) is allowed to lock the semaphore and return from its `sem_wait()`, `sem_trywait()`, or `sem_timedwait()` call. If there are no other tasks waiting on the semaphore, then the semaphore value is simply incremented. `sem_post()` returns 0 upon successful completion.

If an error occurs, the function returns -1 and sets `errno` to the appropriate error code.

NOTES:

Multiprocessing is not supported in this implementation.
9.4.10 sem_getvalue - Get the value of a semaphore

CALLING SEQUENCE:

```c
int sem_getvalue(
    sem_t *sem,
    int *sval
);
```

STATUS CODES:

- EINVAL: The "sem" argument does not refer to a valid semaphore
- ENOSYS: The function sem_getvalue is not supported by this implementation

DESCRIPTION:

The sem_getvalue function sets the location referenced by the "sval" argument to the value of the semaphore without affecting the state of the semaphore. The updated value represents a semaphore value that occurred at some point during the call, but is not necessarily the actual value of the semaphore when it returns to the calling process.

If "sem" is locked, the value returned by sem_getvalue will be zero or a negative number whose absolute value is the number of processes waiting for the semaphore at some point during the call.

NOTES:

If the function completes successfully, it shall return a value of zero. Otherwise, it shall return a value of -1 and set "errno" to specify the error that occurred.
10 Mutex Manager

10.1 Introduction

The mutex manager implements the functionality required of the mutex manager as defined by POSIX 1003.1b-1996. This standard requires that a compliant operating system provide the facilities to ensure that threads can operate with mutual exclusion from one another and defines the API that must be provided.

The services provided by the mutex manager are:

- `pthread_mutexattr_init` - Initialize a Mutex Attribute Set
- `pthread_mutexattr_destroy` - Destroy a Mutex Attribute Set
- `pthread_mutexattr_setprotocol` - Set the Blocking Protocol
- `pthread_mutexattr_getprotocol` - Get the Blocking Protocol
- `pthread_mutexattr_setprioceiling` - Set the Priority Ceiling
- `pthread_mutexattr_getprioceiling` - Get the Priority Ceiling
- `pthread_mutexattr_setpshared` - Set the Visibility
- `pthread_mutexattr_getpshared` - Get the Visibility
- `pthread_mutex_init` - Initialize a Mutex
- `pthread_mutex_destroy` - Destroy a Mutex
- `pthread_mutex_lock` - Lock a Mutex
- `pthread_mutex_trylock` - Poll to Lock a Mutex
- `pthread_mutex_timedlock` - Lock a Mutex with Timeout
- `pthread_mutex_unlock` - Unlock a Mutex
- `pthread_mutex_setprioceiling` - Dynamically Set the Priority Ceiling
- `pthread_mutex_getprioceiling` - Dynamically Get the Priority Ceiling

10.2 Background

10.2.1 Mutex Attributes

Mutex attributes are utilized only at mutex creation time. A mutex attribute structure may be initialized and passed as an argument to the `mutex_init` routine. Note that the priority ceiling of a mutex may be set at run-time.

- `blocking protocol` is the XXX
- `priority ceiling` is the XXX
- `pshared` is the XXX
10.2.2 PTHREAD_MUTEX_INITIALIZER

This is a special value that a variable of type `pthread_mutex_t` may be statically initialized to as shown below:

```c
pthread_mutex_t my_mutex = PTHREAD_MUTEX_INITIALIZER;
```

This indicates that `my_mutex` will be automatically initialized by an implicit call to `pthread_mutex_init` the first time the mutex is used.

Note that the mutex will be initialized with default attributes.

10.3 Operations

There is currently no text in this section.

10.4 Services

This section details the mutex manager’s services. A subsection is dedicated to each of this manager’s services and describes the calling sequence, related constants, usage, and status codes.
10.4.1 pthread_mutexattr_init - Initialize a Mutex Attribute Set

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_init(
    pthread_mutexattr_t *attr
);
```

STATUS CODES:

EINVAL The attribute pointer argument is invalid.

DESCRIPTION:

The `pthread_mutexattr_init` routine initializes the mutex attributes object specified by `attr` with the default value for all of the individual attributes.

NOTES:

XXX insert list of default attributes here.
10.4.2 pthread_mutexattr_destroy - Destroy a Mutex Attribute Set

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_destroy(
    pthread_mutexattr_t *attr
);
```

STATUS CODES:

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.

DESCRIPTION:

The `pthread_mutexattr_destroy` routine is used to destroy a mutex attributes object. The behavior of using an attributes object after it is destroyed is implementation dependent.

NOTES:

NONE
10.4.3 `pthread_mutexattr_setprotocol` - Set the Blocking Protocol

**CALLING SEQUENCE:**

```c
#include <pthread.h>

int pthread_mutexattr_setprotocol(
    pthread_mutexattr_t *attr,
    int protocol
);
```

**STATUS CODES:**

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.
- **EINVAL** The protocol argument is invalid.

**DESCRIPTION:**

The `pthread_mutexattr_setprotocol` routine is used to set value of the `protocol` attribute. This attribute controls the order in which threads waiting on this mutex will receive it.

The `protocol` can be one of the following:

- **PTHREAD_PRIO_NONE** in which case blocking order is FIFO.
- **PTHREAD_PRIO_INHERIT** in which case blocking order is priority with the priority inheritance protocol in effect.
- **PTHREAD_PRIO_PROTECT** in which case blocking order is priority with the priority ceiling protocol in effect.

**NOTES:**

There is currently no way to get simple priority blocking ordering with POSIX mutexes even though this could easily be supported by RTEMS.
10.4.4 pthread_mutexattr_getprotocol - Get the Blocking Protocol

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_getprotocol(
    pthread_mutexattr_t *attr,
    int *protocol
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>The attribute pointer argument is invalid.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>The attribute set is not initialized.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>The protocol pointer argument is invalid.</td>
</tr>
</tbody>
</table>

DESCRIPTION:

The `pthread_mutexattr_getprotocol` routine is used to obtain the value of the `protocol` attribute. This attribute controls the order in which threads waiting on this mutex will receive it.

NOTES:

NONE
10.4.5 pthread_mutexattr_setprioceiling - Set the Priority Ceiling

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_setprioceiling(
    pthread_mutexattr_t *attr,
    int priorityceiling
);
```

STATUS CODES:

- EINVAL The attribute pointer argument is invalid.
- EINVAL The attribute set is not initialized.
- EINVAL The priorityceiling argument is invalid.

DESCRIPTION:

The `pthread_mutexattr_setprioceiling` routine is used to set value of the `priorityceiling` attribute. This attribute specifies the priority that is the ceiling for threads obtaining this mutex. Any task obtaining this mutex may not be of greater priority than the ceiling. If it is of lower priority, then its priority will be elevated to `priorityceiling`.

NOTES:

NONE
10.4.6 pthread_mutexattr_getprioceiling - Get the Priority Ceiling

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_getprioceiling(
    const pthread_mutexattr_t *attr,
    int *prioceiling
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The prioceiling pointer argument is invalid.

DESCRIPTION:

The `pthread_mutexattr_getprioceiling` routine is used to obtain the value of the `prioceiling` attribute. This attribute specifies the priority ceiling for this mutex.

NOTES:

NONE
10.4.7 pthread_mutexattr_setpshared - Set the Visibility

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutexattr_setpshared(
    pthread_mutexattr_t *attr,
    int pshared
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>The attribute pointer argument is invalid.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>The attribute set is not initialized.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>The pshared argument is invalid.</td>
</tr>
</tbody>
</table>

DESCRIPTION:

NOTES:
10.4.8 pthread_mutexattr_getpshared - Get the Visibility

CALLING SEQUENCE:

```
#include <pthread.h>

int pthread_mutexattr_getpshared(
    const pthread_mutexattr_t *attr,
    int *pshared
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The pshared pointer argument is invalid.

DESCRIPTION:

NOTES:
10.4.9 pthread_mutex_init - Initialize a Mutex

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_init(
    pthread_mutex_t *mutex,
    const pthread_mutexattr_t *attr
);
```

STATUS CODES:

- **EINVAL** The attribute set is not initialized.
- **EINVAL** The specified protocol is invalid.
- **EAGAIN** The system lacked the necessary resources to initialize another mutex.
- **ENOMEM** Insufficient memory exists to initialize the mutex.
- **EBUSY** Attempted to reinitalize the object reference by mutex, a previously initialized, but not yet destroyed.

DESCRIPTION:

NOTES:
10.4.10 `pthread_mutex_destroy` - Destroy a Mutex

**CALLING SEQUENCE:**

```c
#include <pthread.h>

int pthread_mutex_destroy(
    pthread_mutex_t *mutex
);
```

**STATUS CODES:**

- **EINVAL** The specified mutex is invalid.
- **EBUSY** Attempted to destroy the object reference by mutex, while it is locked or referenced by another thread.

**DESCRIPTION:**

**NOTES:**
10.4.11 pthread_mutex_lock - Lock a Mutex

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_lock(
    pthread_mutex_t *mutex
);
```

STATUS CODES:

**EINVAL**
- The specified mutex is invalid.

**EINVAL**
- The mutex has the protocol attribute of PTHREAD_PRIO_PROTECT and the priority of the calling thread is higher than the current priority ceiling.

**EDEADLK**
- The current thread already owns the mutex.

DESCRIPTION:

NOTES:
10.4.12 pthread_mutex_trylock - Poll to Lock a Mutex

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_trylock(
    pthread_mutex_t *mutex
);
```

STATUS CODES:

- **EINVAL**: The specified mutex is invalid.
- **EINVAL**: The mutex has the protocol attribute of `PTHREAD_PRIO_PROTECT` and the priority of the calling thread is higher than the current priority ceiling.
- **EDEADLK**: The current thread already owns the mutex.

DESCRIPTION:

NOTES:
10.4.13 `pthread_mutex_timedlock` - Lock a Mutex with Timeout

**CALLING SEQUENCE:**

```c
#include <pthread.h>
#include <time.h>

int pthread_mutex_timedlock(
   pthread_mutex_t *mutex,
   const struct timespec *timeout
);
```

**STATUS CODES:**

- **EINVAL** The specified mutex is invalid.
- **EINVAL** The nanoseconds field of timeout is invalid.
- **EINVAL** The mutex has the protocol attribute of PTHREAD_PRIO_PROTECT and the priority of the calling thread is higher than the current priority ceiling.
- **EDEADLK** The current thread already owns the mutex.

**DESCRIPTION:**

**NOTES:**
10.4.14 pthread_mutex_unlock - Unlock a Mutex

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_unlock(
    pthread_mutex_t *mutex
);
```

STATUS CODES:

EINVAL The specified mutex is invalid.

DESCRIPTION:

NOTES:
10.4.15  pthread_mutex_setprioceiling - Dynamically Set the Priority Ceiling

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_setprioceiling(
    pthread_mutex_t *mutex,
    int    prioceiling,
    int *oldceiling
);
```

STATUS CODES:

- **EINVAL**: The oldceiling pointer parameter is invalid.
- **EINVAL**: The prioceiling parameter is an invalid priority.
- **EINVAL**: The specified mutex is invalid.

DESCRIPTION:

NOTES:
10.4.16 pthread_mutex_getprioceiling - Get the Current Priority Ceiling

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_mutex_getprioceiling(
    pthread_mutex_t *mutex,
    int *prioceiling
);
```

STATUS CODES:

EINVAL The prioceiling pointer parameter is invalid.
EINVAL The specified mutex is invalid.

13 Scheduler Manager

13.1 Introduction

The scheduler manager ...

The directives provided by the scheduler manager are:

- `sched_get_priority_min` - Get Minimum Priority Value
- `sched_get_priority_max` - Get Maximum Priority Value
- `sched_rr_get_interval` - Get Timeslicing Quantum
- `sched_yield` - Yield the Processor

13.2 Background

13.2.1 Priority

In the RTEMS implementation of the POSIX API, the priorities range from the low priority of `sched_get_priority_min()` to the highest priority of `sched_get_priority_max()`. Numerically higher values represent higher priorities.

13.2.2 Scheduling Policies

The following scheduling policies are available:

- **SCHED_FIFO**
  Priority-based, preemptive scheduling with no timeslicing. This is equivalent to what is called "manual round-robin" scheduling.

- **SCHED_RR**
  Priority-based, preemptive scheduling with timeslicing. Time quanta are maintained on a per-thread basis and are not reset at each context switch. Thus, a thread which is preempted and subsequently resumes execution will attempt to complete the unused portion of its time quantum.

- **SCHED_OTHER**
  Priority-based, preemptive scheduling with timeslicing. Time quanta are maintained on a per-thread basis and are reset at each context switch.

- **SCHED_SPORADIC**
  Priority-based, preemptive scheduling utilizing three additional parameters: budget, replenishment period, and low priority. Under this policy, the thread is allowed to execute for "budget" amount of time before its priority is lowered to "low priority". At the end of each replenishment period, the thread resumes its initial priority and has its budget replenished.
13.3 Operations

There is currently no text in this section.

13.4 Directives

This section details the scheduler manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
13.4.1 sched_get_priority_min - Get Minimum Priority Value

CALLING SEQUENCE:

```
#include <sched.h>

int sched_get_priority_min(
    int policy
);
```

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

**EINVAL** The indicated policy is invalid.

DESCRIPTION:

This routine return the minimum (numerically and logically lowest) priority for the specified policy.

NOTES:

NONE
13.4.2 sched_get_priority_max - Get Maximum Priority Value

CALLING SEQUENCE:

    #include <sched.h>

    int sched_get_priority_max(
        int policy
    );

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

EINVAL          The indicated policy is invalid.

DESCRIPTION:

This routine return the maximum (numerically and logically highest) priority for the specified policy.

NOTES:

NONE
13.4.3 sched_rr_get_interval - Get Timeslicing Quantum

CALLING SEQUENCE:

```
#include <sched.h>

int sched_rr_get_interval(
    pid_t pid,
    struct timespec *interval
);
```

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

- **ESRCH**: The indicated process id is invalid.
- **EINVAL**: The specified interval pointer parameter is invalid.

DESCRIPTION:

This routine returns the length of the timeslice quantum in the `interval` parameter for the specified `pid`.

NOTES:

The `pid` argument should be 0 to indicate the calling process.
13.4.4 sched_yield - Yield the Processor

CALLING SEQUENCE:

```c
#include <sched.h>

int sched_yield( void );
```

STATUS CODES:

This routine always returns zero to indicate success.

DESCRIPTION:

This call forces the calling thread to yield the processor to another thread. Normally this is used to implement voluntary round-robin task scheduling.

NOTES:

NONE
14 Clock Manager

14.1 Introduction

The clock manager ...

The directives provided by the clock manager are:

- `clock_gettime` - Obtain Time of Day
- `clock_settime` - Set Time of Day
- `clock_getres` - Get Clock Resolution
- `sleep` - Delay Process Execution
- `nanosleep` - Delay with High Resolution
- `gettimeofday` - Get the Time of Day
- `time` - Get time in seconds

14.2 Background

There is currently no text in this section.

14.3 Operations

There is currently no text in this section.

14.4 Directives

This section details the clock manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.

14.4.1 `clock_gettime` - Obtain Time of Day

CALLING SEQUENCE:

```c
#include <time.h>

int clock_gettime(
    clockid_t clock_id,
    struct timespec *tp
);
```
STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

EINVAL  The tp pointer parameter is invalid.
EINVAL  The clock_id specified is invalid.

DESCRIPTION:

NOTES:

NONE
14.4.2 clock_settime - Set Time of Day

**CALLING SEQUENCE:**

```c
#include <time.h>

int clock_settime(
    clockid_t clock_id,
    const struct timespec *tp
);
```

**STATUS CODES:**

On error, this routine returns -1 and sets errno to one of the following:

- **EINVAL** The tp pointer parameter is invalid.
- **EINVAL** The clock_id specified is invalid.
- **EINVAL** The contents of the tp structure are invalid.

**DESCRIPTION:**

**NOTES:**

NONE
14.4.3 clock_getres - Get Clock Resolution

CALLING SEQUENCE:

```c
#include <time.h>

int clock_getres(
    clockid_t clock_id,
    struct timespec *res
);
```

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

- EINVAL The res pointer parameter is invalid.
- EINVAL The clock_id specified is invalid.

DESCRIPTION:

NOTES:

If res is NULL, then the resolution is not returned.
14.4.4 sleep - Delay Process Execution

CALLING SEQUENCE:

```c
#include <time.h>

unsigned int sleep(
    unsigned int seconds
);
```

STATUS CODES:

This routine returns the number of unslept seconds.

DESCRIPTION:

The `sleep()` function delays the calling thread by the specified number of `seconds`.

NOTES:

This call is interruptible by a signal.
14.4.5 nanosleep - Delay with High Resolution

CALLING SEQUENCE:

```c
#include <time.h>

int nanosleep(
    const struct timespec *rqtp,
    struct timespec *rmtp
);
```

STATUS CODES:

On error, this routine returns -1 and sets errno to one of the following:

- **EINTR** The routine was interrupted by a signal.
- **EAGAIN** The requested sleep period specified negative seconds or nanoseconds.
- **EINVAL** The requested sleep period specified an invalid number for the nanoseconds field.

DESCRIPTION:

NOTES:

This call is interruptible by a signal.
14.4.6 gettimeofday - Get the Time of Day

CALLING SEQUENCE:

```c
#include <sys/time.h>
#include <unistd.h>

int gettimeofday(
    struct timeval *tp,
    struct timezone *tzp
);
```

STATUS CODES:

On error, this routine returns -1 and sets `errno` as appropriate.

- **EPERM**: `settimeofday` is called by someone other than the superuser.
- **EINVAL**: Timezone (or something else) is invalid.
- **EFAULT**: One of `tv` or `tz` pointed outside your accessible address space.

DESCRIPTION:

This routine returns the current time of day in the `tp` structure.

NOTES:

Currently, the timezone information is not supported. The `tzp` argument is ignored.
14.4.7 time - Get time in seconds

CALLING SEQUENCE:

#include <time.h>

int time(
        time_t *tloc
);

STATUS CODES:

This routine returns the number of seconds since the Epoch.

DESCRIPTION:

time returns the time since 00:00:00 GMT, January 1, 1970, measured in seconds
If tloc in non null, the return value is also stored in the memory pointed to by t.

NOTES:

NONE
15 Timer Manager

15.1 Introduction

The timer manager is ...

The services provided by the timer manager are:

- `timer_create` - Create a Per-Process Timer
- `timer_delete` - Delete a Per-Process Timer
- `timer_settime` - Set Next Timer Expiration
- `timer_gettime` - Get Time Remaining on Timer
- `timer_getoverrun` - Get Timer Overrun Count

15.2 Background

15.3 Operations

15.4 System Calls

This section details the timer manager’s services. A subsection is dedicated to each of this manager’s services and describes the calling sequence, related constants, usage, and status codes.
15.4.1 timer_create - Create a Per-Process Timer

CALLING SEQUENCE:

```c
#include <time.h>
#include <signal.h>

int timer_create(
    clockid_t clock_id,
    struct sigevent *evp,
    timer_t *timerid
);
```

STATUS CODES:

EXXX -

DESCRIPTION:

NOTES:
15.4.2 timer_delete - Delete a Per-Process Timer

CALLING SEQUENCE:

```c
#include <time.h>

int timer_delete(
    timer_t timerid
);
```

STATUS CODES:

EXXX -

DESCRIPTION:

NOTES:
15.4.3 timer_settime - Set Next Timer Expiration

CALLING SEQUENCE:

#include <time.h>

int timer_settime(
  timer_t timerid,
  int flags,
  const struct itimerspec *value,
  struct itimerspec *ovalue
);

STATUS CODES:

EXXX -

DESCRIPTION:

NOTES:
15.4.4 timer_gettime - Get Time Remaining on Timer

CALLING SEQUENCE:

```c
#include <time.h>

int timer_gettime(
    timer_t timerid,
    struct itimerspec *value
);
```

STATUS CODES:

EXXX -

DESCRIPTION:

NOTES:
15.4.5 timer_getoverrun - Get Timer Overrun Count

CALLING SEQUENCE:

```c
#include <time.h>

int timer_getoverrun(
    timer_t timerid
);
```

STATUS CODES:

EXXX -

DESCRIPTION:

NOTES:
16 Message Passing Manager

16.1 Introduction

The message passing manager is the means to provide communication and synchronization capabilities using POSIX message queues.

The directives provided by the message passing manager are:

- `mq_open` - Open a Message Queue
- `mq_close` - Close a Message Queue
- `mq_unlink` - Remove a Message Queue
- `mq_send` - Send a Message to a Message Queue
- `mq_receive` - Receive a Message from a Message Queue
- `mq_notify` - Notify Process that a Message is Available
- `mq_setattr` - Set Message Queue Attributes
- `mq_getattr` - Get Message Queue Attributes

16.2 Background

16.2.1 Theory

Message queues are named objects that operate with readers and writers. In addition, a message queue is a priority queue of discrete messages. POSIX message queues offer a certain, basic amount of application access to, and control over, the message queue geometry that can be changed.

16.2.2 Messages

A message is a variable length buffer where information can be stored to support communication. The length of the message and the information stored in that message are user-defined and can be actual data, pointer(s), or empty. There is a maximum acceptable length for a message that is associated with each message queue.

16.2.3 Message Queues

Message queues are named objects similar to the pipes of POSIX. They are a means of communicating data between multiple processes and for passing messages among tasks and ISRs. Message queues can contain a variable number of messages from 0 to an upper limit that is user defined. The maximum length of the message can be set on a per message queue basis. Normally messages are sent and received from the message queue in FIFO
order. However, messages can also be prioritized and a priority queue established for the passing of messages. Synchronization is needed when a task waits for a message to arrive at a queue. Also, a task may poll a queue for the arrival of a message.

The message queue descriptor `mqd_t` represents the message queue. It is passed as an argument to all of the message queue functions.

### 16.2.4 Building a Message Queue Attribute Set

The `mq_attr` structure is used to define the characteristics of the message queue.

```c
typedef struct mq_attr{
    long mq_flags;
    long mq_maxmsg;
    long mq_msgsize;
    long mq_curmsgs;
};
```

All of these attributes are set when the message queue is created using `mq_open`. The `mq_flags` field is not used in the creation of a message queue, it is only used by `mq_setattr` and `mqgetattr`. The structure `mq_attr` is passed as an argument to `mq_setattr` and `mq_getattr`.

The `mq_flags` contain information affecting the behavior of the message queue. The `O_NONBLOCK` `mq_flag` is the only flag that is defined. In `mq_setattr`, the `mq_flag` can be set to dynamically change the blocking and non-blocking behavior of the message queue. If the non-block flag is set then the message queue is non-blocking, and requests to send and receive messages do not block waiting for resources. For a blocking message queue, a request to send might have to wait for an empty message queue, and a request to receive might have to wait for a message to arrive on the queue. Both `mq_maxmsg` and `mq_msgsize` affect the sizing of the message queue. `mq_maxmsg` specifies how many messages the queue can hold at any one time. `mq_msgsize` specifies the size of any one message on the queue. If either of these limits is exceeded, an error message results.

Upon return from `mq_getattr`, the `mq_curmsgs` is set according to the current state of the message queue. This specifies the number of messages currently on the queue.

### 16.2.5 Notification of a Message on the Queue

Every message queue has the ability to notify one (and only one) process whenever the queue’s state changes from empty (0 messages) to nonempty. This means that the process does not have to block or constantly poll while it waits for a message. By calling `mq_notify`, you can attach a notification request to a message queue. When a message is received by an empty queue, if there are no processes blocked and waiting for the message, then the queue notifies the requesting process of a message arrival. There is only one signal sent by the message queue, after that the notification request is de-registered and another process can attach its notification request. After receipt of a notification, a process must re-register if it wishes to be notified again.
If there is a process blocked and waiting for the message, that process gets the message, and notification is not sent. It is also possible for another process to receive the message after the notification is sent but before the notified process has sent its receive request.

Only one process can have a notification request attached to a message queue at any one time. If another process attempts to register a notification request, it fails. You can de-register for a message queue by passing a NULL to `mq_notify`, this removes any notification request attached to the queue. Whenever the message queue is closed, all notification attachments are removed.

### 16.2.6 POSIX Interpretation Issues

There is one significant point of interpretation related to the RTEMS implementation of POSIX message queues:

*What happens to threads already blocked on a message queue when the mode of that same message queue is changed from blocking to non-blocking?*

The RTEMS POSIX implementation decided to unblock all waiting tasks with an `EAGAIN` status just as if a non-blocking version of the same operation had returned unsatisfied. This case is not discussed in the POSIX standard and other implementations may have chosen alternative behaviors.

### 16.3 Operations

#### 16.3.1 Opening or Creating a Message Queue

If the message queue already exists, `mq_open()` opens it, if the message queue does not exist, `mq_open()` creates it. When a message queue is created, the geometry of the message queue is contained in the attribute structure that is passed in as an argument. This includes `mq_msgsize` that dictates the maximum size of a single message, and the `mq_maxmsg` that dictates the maximum number of messages the queue can hold at one time. The blocking or non-blocking behavior of the queue can also specified.

#### 16.3.2 Closing a Message Queue

The `mq_close()` function is used to close the connection made to a message queue that was made during `mq_open`. The message queue itself and the messages on the queue are persistent and remain after the queue is closed.

#### 16.3.3 Removing a Message Queue

The `mq_unlink()` function removes the named message queue. If the message queue is not open when `mq_unlink` is called, then the queue is immediately eliminated. Any messages
that were on the queue are lost, and the queue can not be opened again. If processes have
the queue open when mq_unlink is called, the removal of the queue is delayed until the last
process using the queue has finished. However, the name of the message queue is removed
so that no other process can open it.

16.3.4 Sending a Message to a Message Queue

The mq_send() function adds the message in priority order to the message queue. Each
message has an assigned a priority. The highest priority message is be at the front of the
queue.

The maximum number of messages that a message queue may accept is specified at creation
by the mq_maxmsg field of the attribute structure. If this amount is exceeded, the behavior
of the process is determined according to what oflag was used when the message queue was
opened. If the queue was opened with O_NONBLOCK flag set, the process does not block,
and an error is returned. If the O_NONBLOCK flag was not set, the process does block
and wait for space on the queue.

16.3.5 Receiving a Message from a Message Queue

The mq_receive() function is used to receive the oldest of the highest priority message(s)
from the message queue specified by mqdes. The messages are received in FIFO order
within the priorities. The received message’s priority is stored in the location referenced by
the msg_prio. If the msg_prio is a NULL, the priority is discarded. The message is removed
and stored in an area pointed to by msg_ptr whose length is of msg_len. The msg_len must
be at least equal to the mq_msgsize attribute of the message queue.

The blocking behavior of the message queue is set by O_NONBLOCK at mq_open or by
setting O_NONBLOCK in mq_flags in a call to mq_setattr. If this is a blocking queue, the
process does block and wait on an empty queue. If this a non-blocking queue, the process
does not block. Upon successful completion, mq_receive returns the length of the selected
message in bytes and the message is removed from the queue.

16.3.6 Notification of Receipt of a Message on an Empty Queue

The mq_notify() function registers the calling process to be notified of message arrival at
an empty message queue. Every message queue has the ability to notify one (and only
one) process whenever the queue’s state changes from empty (0 messages) to nonempty.
This means that the process does not have to block or constantly poll while it waits for a
message. By calling mq_notify, a notification request is attached to a message queue. When
a message is received by an empty queue, if there are no processes blocked and waiting for
the message, then the queue notifies the requesting process of a message arrival. There is
only one signal sent by the message queue, after that the notification request is de-registered
and another process can attach its notification request. After receipt of a notification, a
process must re-register if it wishes to be notified again.
If there is a process blocked and waiting for the message, that process gets the message, and notification is not sent. Only one process can have a notification request attached to a message queue at any one time. If another process attempts to register a notification request, it fails. You can de-register for a message queue by passing a NULL to `mq_notify`, this removes any notification request attached to the queue. Whenever the message queue is closed, all notification attachments are removed.

### 16.3.7 Setting the Attributes of a Message Queue

The `mq_setattr()` function is used to set attributes associated with the open message queue description referenced by the message queue descriptor specified by `mqdes`. The `omqstat` represents the old or previous attributes. If `omqstat` is non-NULL, the function `mq_setattr()` stores, in the location referenced by `omqstat`, the previous message queue attributes and the current queue status. These values are the same as would be returned by a call to `mq_getattr()` at that point.

There is only one `mq_attr.mq_flag` that can be altered by this call. This is the flag that deals with the blocking and non-blocking behavior of the message queue. If the flag is set then the message queue is non-blocking, and requests to send or receive do not block while waiting for resources. If the flag is not set, then message send and receive may involve waiting for an empty queue or waiting for a message to arrive.

### 16.3.8 Getting the Attributes of a Message Queue

The `mq_getattr()` function is used to get status information and attributes of the message queue associated with the message queue descriptor. The results are returned in the `mq_attr` structure referenced by the `mqstat` argument. All of these attributes are set at create time, except the blocking/non-blocking behavior of the message queue which can be dynamically set by using `mq_setattr`. The attribute `mq_curmsg` is set to reflect the number of messages on the queue at the time that `mq_getattr` was called.

### 16.4 Directives

This section details the message passing manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
16.4.1 mq_open - Open a Message Queue

CALLING SEQUENCE:

```c
#include <mqueue.h>

mqd_t mq_open(
    const char *name,
    int oflag,
    mode_t mode,
    struct mq_attr *attr
);
```

STATUS CODES:

EACCES - Either the message queue exists and the permissions requested in oflags were denied, or the message does not exist and permission to create one is denied.

EEXIST - You tried to create a message queue that already exists.

EINVAL - An inappropriate name was given for the message queue, or the values of mq-maxmsg or mq-msgsize were less than 0.

ENOENT - The message queue does not exist, and you did not specify to create it.

EINTR - The call to mq_open was interrupted by a signal.

EMFILE - The process has too many files or message queues open. This is a process limit error.

ENFILE - The system has run out of resources to support more open message queues. This is a system error.

ENAMETOOLONG - mq_name is too long.

DESCRIPTION:

The mq_open () function establishes the connection between a process and a message queue with a message queue descriptor. If the message queue already exists, mq_open opens it, if the message queue does not exist, mq_open creates it. Message queues can have multiple senders and receivers. If mq_open is successful, the function returns a message queue descriptor. Otherwise, the function returns a -1 and sets 'errno' to indicate the error.

The name of the message queue is used as an argument. For the best of portability, the name of the message queue should begin with a "/" and no other "/" should be in the name. Different systems interpret the name in different ways.
The oflags contain information on how the message is opened if the queue already exists. This may be O_RDONLY for read only, O_WRONLY for write only, or O_RDWR, for read and write.

In addition, the oflags contain information needed in the creation of a message queue. O_NONBLOCK - If the non-block flag is set then the message queue is non-blocking, and requests to send and receive messages do not block waiting for resources. If the flag is not set then the message queue is blocking, and a request to send might have to wait for an empty message queue. Similarly, a request to receive might have to wait for a message to arrive on the queue. O_CREAT - This call specifies that the call the `mq_open` is to create a new message queue. In this case the mode and attribute arguments of the function call are utilized. The message queue is created with a mode similar to the creation of a file, read and write permission creator, group, and others.

The geometry of the message queue is contained in the attribute structure. This includes `mq_msgsize` that dictates the maximum size of a single message, and the `mq_maxmsg` that dictates the maximum number of messages the queue can hold at one time. If a NULL is used in the `mq_attr` argument, then the message queue is created with implementation defined defaults. O_EXCL - is always set if O_CREAT flag is set. If the message queue already exists, O_EXCL causes an error message to be returned, otherwise, the new message queue fails and appends to the existing one.

NOTES:

The `mq_open` function does not add or remove messages from the queue. When a new message queue is being created, the `mq_flag` field of the attribute structure is not used.
16.4.2 mq_close - Close a Message Queue

**CALLING SEQUENCE:**

```c
#include <mqueue.h>

int mq_close(
    mqd_t mqdes
);
```

**STATUS CODES:**

EINVAL - The descriptor does not represent a valid open message queue

**DESCRIPTION:**

The `mq_close` function removes the association between the message queue descriptor, `mqdes`, and its message queue. If `mq_close()` is successfully completed, the function returns a value of zero; otherwise, the function returns a value of -1 and sets `errno` to indicate the error.

**NOTES:**

If the process had successfully attached a notification request to the message queue via `mq_notify`, this attachment is removed, and the message queue is available for another process to attach for notification. `mq_close` has no effect on the contents of the message queue, all the messages that were in the queue remain in the queue.
16.4.3 mq_unlink - Remove a Message Queue

CALLING SEQUENCE:

```
#include <mqueue.h>

int mq_unlink(
    const char *name
);
```

STATUS CODES:

EINVAL - The descriptor does not represent a valid message queue

DESCRIPTION:

The mq_unlink() function removes the named message queue. If the message queue is not open when mq_unlink is called, then the queue is immediately eliminated. Any messages that were on the queue are lost, and the queue can not be opened again. If processes have the queue open when mq_unlink is called, the removal of the queue is delayed until the last process using the queue has finished. However, the name of the message queue is removed so that no other process can open it. Upon successful completion, the function returns a value of zero. Otherwise, the named message queue is not changed by this function call, and the function returns a value of -1 and sets errno to indicate the error.

NOTES:

Calls to mq_open() to re-create the message queue may fail until the message queue is actually removed. However, the mq_unlink() call need not block until all references have been closed; it may return immediately.
16.4.4 mq_send - Send a Message to a Message Queue

CALLING SEQUENCE:

```c
#include<mqueue.h>
int mq_send(
    mqd_t mqdes,
    const char *msg_ptr,
    size_t msg_len,
    unsigned int msg_prio
);
```

STATUS CODES:

EBADF - The descriptor does not represent a valid message queue, or the queue was opened for read only O_RDONLY.
EINVAL - The value of msg_prio was greater than the MQ_PRIOR_MAX.
EMSGSIZE - The msg_len is greater than the mq_msgsize attribute of the message queue.
EAGAIN - The message queue is non-blocking, and there is no room on the queue for another message as specified by the mq_maxmsg.
EINTR - The message queue is blocking. While the process was waiting for free space on the queue, a signal arrived that interrupted the wait.

DESCRIPTION:

The mq_send() function adds the message pointed to by the argument msg_ptr to the message queue specified by mqdes. Each message is assigned a priority, from 0 to MQ_PRIOR_MAX. MQ_PRIOR_MAX is defined in <limits.h> and must be at least 32. Messages are added to the queue in order of their priority. The highest priority message is at the front of the queue.

The maximum number of messages that a message queue may accept is specified at creation by the mq_maxmsg field of the attribute structure. If this amount is exceeded, the behavior of the process is determined according to what oflag was used when the message queue was opened. If the queue was opened with O_NONBLOCK flag set, then the EAGAIN error is returned. If the O_NONBLOCK flag was not set, the process blocks and waits for space on the queue, unless it is interrupted by a signal.

Upon successful completion, the mq_send() function returns a value of zero. Otherwise, no message is enqueued, the function returns -1, and errno is set to indicate the error.

NOTES:

If the specified message queue is not full, mq_send inserts the message at the position indicated by the msg_prio argument.
16.4.5 \texttt{mq\_receive} - Receive a Message from a Message Queue

\textbf{CALLING SEQUENCE:}

\begin{verbatim}
#include <mqueue.h>

size_t mq_receive(
    mqd_t mqdes,
    char *msg_ptr,
    size_t msg_len,
    unsigned int *msg_prio
);
\end{verbatim}

\textbf{STATUS CODES:}

\begin{itemize}
\item \texttt{EBADF} - The descriptor does not represent a valid message queue, or the queue was opened for write only \texttt{O\_WRONLY EMSGSIZE} - The \texttt{msg\_len} is less than the \texttt{mq\_msgsize} attribute of the message queue \texttt{EAGAIN} - The message queue is non-blocking, and the queue is empty \texttt{EINVAL} - The message queue is blocking. While the process was waiting for a message to arrive on the queue, a signal arrived that interrupted the wait.
\end{itemize}

\textbf{DESCRIPTION:}

The \texttt{mq\_receive} function is used to receive the oldest of the highest priority message(s) from the message queue specified by \texttt{mqdes}. The messages are received in FIFO order within the priorities. The received message's priority is stored in the location referenced by the \texttt{msg\_prio}. If the \texttt{msg\_prio} is a \texttt{NULL}, the priority is discarded. The message is removed and stored in an area pointed to by \texttt{msg\_ptr} whose length is of \texttt{msg\_len}. The \texttt{msg\_len} must be at least equal to the \texttt{mq\_msgsize} attribute of the message queue.

The blocking behavior of the message queue is set by \texttt{O\_NONBLOCK} at \texttt{mq\_open} or by setting \texttt{O\_NONBLOCK} in \texttt{mq\_flags} in a call to \texttt{mq\_setattr}. If this is a blocking queue, the process blocks and waits on an empty queue. If this a non-blocking queue, the process does not block.

Upon successful completion, \texttt{mq\_receive} returns the length of the selected message in bytes and the message is removed from the queue. Otherwise, no message is removed from the queue, the function returns a value of -1, and sets \texttt{errno} to indicate the error.

\textbf{NOTES:}

If the size of the buffer in bytes, specified by the \texttt{msg\_len} argument, is less than the \texttt{mq\_msgsize} attribute of the message queue, the function fails and returns an error.
16.4.6 mq_notify - Notify Process that a Message is Available

CALLING SEQUENCE:

```c
#include <mqueue.h>

int mq_notify(
    mqd_t mqdes,
    const struct sigevent *notification
);
```

STATUS CODES:

- EBADF - The descriptor does not refer to a valid message queue
- EBUSY - A notification request is already attached to the queue

DESCRIPTION:

If the argument notification is not NULL, this function registers the calling process to be notified of message arrival at an empty message queue associated with the specified message queue descriptor, mqdes.

Every message queue has the ability to notify one (and only one) process whenever the queue's state changes from empty (0 messages) to nonempty. This means that the process does not have to block or constantly poll while it waits for a message. By calling mq_notify, a notification request is attached to a message queue. When a message is received by an empty queue, if there are no processes blocked and waiting for the message, then the queue notifies the requesting process of a message arrival. There is only one signal sent by the message queue, after that the notification request is de-registered and another process can attach its notification request. After receipt of a notification, a process must re-register if it wishes to be notified again.

If there is a process blocked and waiting for the message, that process gets the message, and notification is not be sent. Only one process can have a notification request attached to a message queue at any one time. If another process attempts to register a notification request, it fails. You can de-register for a message queue by passing a NULL to mq_notify; this removes any notification request attached to the queue. Whenever the message queue is closed, all notification attachments are removed.

Upon successful completion, mq_notify returns a value of zero; otherwise, the function returns a value of -1 and sets errno to indicate the error.
NOTES:

It is possible for another process to receive the message after the notification is sent but before the notified process has sent its receive request.
16.4.7 mq_setattr - Set Message Queue Attributes

CALLING SEQUENCE:

```
#include <mqueue.h>

int mq_setattr(
    mqd_t mqdes,       // Message queue descriptor
    const struct mq_attr *mqstat, // New attributes
    struct mq_attr *omqstat // Old attributes
);
```

STATUS CODES:

- **EBADF** - The message queue descriptor does not refer to a valid, open queue.
- **EINVAL** - The `mq` flag value is invalid.

DESCRIPTION:

The `mq_setattr` function is used to set attributes associated with the open message queue
description referenced by the message queue descriptor specified by `mqdes`. The `omqstat`
represents the old or previous attributes. If `omqstat` is non-NULL, the function `mq_setattr()`
stores, in the location referenced by `omqstat`, the previous message queue attributes and
the current queue status. These values are the same as would be returned by a call to
`mq_getattr()` at that point.

There is only one `mq_attr.mq_flag` which can be altered by this call. This is the flag that
deals with the blocking and non-blocking behavior of the message queue. If the flag is set
then the message queue is non-blocking, and requests to send or receive do not block while
waiting for resources. If the flag is not set, then message send and receive may involve
waiting for an empty queue or waiting for a message to arrive.

Upon successful completion, the function returns a value of zero and the attributes of the
message queue have been changed as specified. Otherwise, the message queue attributes is
unchanged, and the function returns a value of -1 and sets `errno` to indicate the error.

NOTES:

All other fields in the `mq_attr` are ignored by this call.
16.4.8 mq_getattr - Get Message Queue Attributes

CALLING SEQUENCE:

```c
#include <mqueue.h>
int mq_getattr(
    mqd_t mqdes,
    struct mq_attr *mqstat
);
```

STATUS CODES:

EBADF - The message queue descriptor does not refer to a valid, open message queue.

DESCRIPTION:

The mqdes argument specifies a message queue descriptor. The mq_getattr function is used to get status information and attributes of the message queue associated with the message queue descriptor. The results are returned in the mq_attr structure referenced by the mqstat argument. All of these attributes are set at create time, except the blocking/non-blocking behavior of the message queue which can be dynamically set by using mq_setattr. The attribute mq_curmsg is set to reflect the number of messages on the queue at the time that mq_getattr was called.

Upon successful completion, the mq_getattr function returns zero. Otherwise, the function returns -1 and sets errno to indicate the error.

NOTES:
17 Thread Manager

17.1 Introduction

The thread manager implements the functionality required of the thread manager as defined by POSIX 1003.1b-1996. This standard requires that a compliant operating system provide the facilities to manage multiple threads of control and defines the API that must be provided.

The services provided by the thread manager are:

- `pthread_attr_init` - Initialize a Thread Attribute Set
- `pthread_attr_destroy` - Destroy a Thread Attribute Set
- `pthread_attr_setdetachstate` - Set Detach State
- `pthread_attr_getdetachstate` - Get Detach State
- `pthread_attr_setstacksize` - Set Thread Stack Size
- `pthread_attr_getstacksize` - Get Thread Stack Size
- `pthread_attr_setstackaddr` - Set Thread Stack Address
- `pthread_attr_getstackaddr` - Get Thread Stack Address
- `pthread_attr_setscope` - Set Thread Scheduling Scope
- `pthread_attr_getscope` - Get Thread Scheduling Scope
- `pthread_attr_setinheritsched` - Set Inherit Scheduler Flag
- `pthread_attr_getinheritsched` - Get Inherit Scheduler Flag
- `pthread_attr_setschedpolicy` - Set Scheduling Policy
- `pthread_attr_getschedpolicy` - Get Scheduling Policy
- `pthread_attr_setschedparam` - Set Scheduling Parameters
- `pthread_attr_getschedparam` - Get Scheduling Parameters
- `pthread_create` - Create a Thread
- `pthread_exit` - Terminate the Current Thread
- `pthread_detach` - Detach a Thread
- `pthread_join` - Wait for Thread Termination
- `pthread_self` - Get Thread ID
- `pthread_equal` - Compare Thread IDs
- `pthread_once` - Dynamic Package Initialization
- `pthread_setschedparam` - Set Thread Scheduling Parameters
- `pthread_getschedparam` - Get Thread Scheduling Parameters
17.2 Background

17.2.1 Thread Attributes

Thread attributes are utilized only at thread creation time. A thread attribute structure may be initialized and passed as an argument to the `pthread_create` routine.

stack address is the address of the optionally user specified stack area for this thread. If this value is NULL, then RTEMS allocates the memory for the thread stack from the RTEMS Workspace Area. Otherwise, this is the user specified address for the memory to be used for the thread’s stack. Each thread must have a distinct stack area. Each processor family has different alignment rules which should be followed.

stack size is the minimum desired size for this thread’s stack area. If the size of this area as specified by the stack size attribute is smaller than the minimum for this processor family and the stack is not user specified, then RTEMS will automatically allocate a stack of the minimum size for this processor family.

contention scope specifies the scheduling contention scope. RTEMS only supports the PTHREAD_SCOPE_PROCESS scheduling contention scope.

scheduling inheritance specifies whether a user specified or the scheduling policy and parameters of the currently executing thread are to be used. When this is PTHREAD_INHERIT_SCHED, then the scheduling policy and parameters of the currently executing thread are inherited by the newly created thread.

scheduling policy and parameters specify the manner in which the thread will contend for the processor. The scheduling parameters are interpreted based on the specified policy. All policies utilize the thread priority parameter.

17.3 Operations

There is currently no text in this section.

17.4 Services

This section details the thread manager’s services. A subsection is dedicated to each of this manager’s services and describes the calling sequence, related constants, usage, and status codes.
17.4.1 pthread_attr_init - Initialize a Thread Attribute Set

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_init(
    pthread_attr_t *attr
);
```

STATUS CODES:

EINVAL The attribute pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_init` routine initializes the thread attributes object specified by `attr` with the default value for all of the individual attributes.

NOTES:

The settings in the default attributes are implementation defined. For RTEMS, the default attributes are as follows:

- stackadr is not set to indicate that RTEMS is to allocate the stack memory.
- stacksize is set to `PTHREAD_MINIMUM_STACK_SIZE`.
- contentscope is set to `PTHREAD_SCOPE_PROCESS`.
- inheritsched is set to `PTHREAD_INHERIT_SCHED` to indicate that the created thread inherits its scheduling attributes from its parent.
- detachstate is set to `PTHREAD_CREATE_JOINABLE`. 
17.4.2 pthread_attr_destroy - Destroy a Thread Attribute Set

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_destroy(
    pthread_attr_t *attr
);
```

STATUS CODES:

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.

DESCRIPTION:

The `pthread_attr_destroy` routine is used to destroy a thread attributes object. The behavior of using an attributes object after it is destroyed is implementation dependent.

NOTES:

NONE
17.4.3 pthread_attr_setdetachstate - Set Detach State

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_setdetachstate(
    pthread_attr_t *attr,
    int              detachstate
);
```

STATUS CODES:

- **EINVAL**: The attribute pointer argument is invalid.
- **EINVAL**: The attribute set is not initialized.
- **EINVAL**: The detachstate argument is invalid.

DESCRIPTION:

The `pthread_attr_setdetachstate` routine is used to value of the `detachstate` attribute. This attribute controls whether the thread is created in a detached state.

The `detachstate` can be either `PTHREAD_CREATE_DETACHED` or `PTHREAD_CREATE_JOINABLE`. The default value for all threads is `PTHREAD_CREATE_JOINABLE`.

NOTES:

If a thread is in a detached state, then the use of the ID with the `pthread_detach` or `pthread_join` routines is an error.
17.4.4 pthread_attr_getdetachstate - Get Detach State

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_getdetachstate(
    const pthread_attr_t *attr,
    int *detachstate
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The detachstate pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_getdetachstate` routine is used to obtain the current value of the `detachstate` attribute as specified by the `attr` thread attribute object.

NOTES:

NONE
17.4.5 `pthread_attr_setstacksize` - Set Thread Stack Size

**CALLING SEQUENCE:**

```c
#include <pthread.h>

int pthread_attr_setstacksize(
    pthread_attr_t *attr,
    size_t stacksize
);
```

**STATUS CODES:**

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.

**DESCRIPTION:**

The `pthread_attr_setstacksize` routine is used to set the `stacksize` attribute in the `attr` thread attribute object.

**NOTES:**

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_ATTR_STACKSIZE` to indicate that this routine is supported.

If the specified stacksize is below the minimum required for this CPU (`PTHREAD_STACK_MIN`, then the stacksize will be set to the minimum for this CPU.
17.4.6 pthread_attr_getstacksize - Get Thread Stack Size

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_getstacksize(
    const pthread_attr_t *attr,
    size_t *stacksize
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The stacksize pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_getstacksize` routine is used to obtain the `stacksize` attribute in the `attr` thread attribute object.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_ATTR_STACKSIZE` to indicate that this routine is supported.
17.4.7 pthread_attr_setstackaddr - Set Thread Stack Address

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_setstackaddr(
    pthread_attr_t *attr,
    void *stackaddr
);
```

STATUS CODES:

- EINVAL The attribute pointer argument is invalid.
- EINVAL The attribute set is not initialized.

DESCRIPTION:

The `pthread_attr_setstackaddr` routine is used to set the `stackaddr` attribute in the `attr` thread attribute object.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_ATTR_STACKADDR` to indicate that this routine is supported.

It is imperative to the proper operation of the system that each thread have sufficient stack space.
17.4.8 pthread_attr_getstackaddr - Get Thread Stack Address

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_getstackaddr(
    const pthread_attr_t *attr,
    void **stackaddr
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The stackaddr pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_getstackaddr` routine is used to obtain the stackaddr attribute in the attr thread attribute object.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_ATTR_STACKADDR` to indicate that this routine is supported.
17.4.9  pthread_attr_setscope - Set Thread Scheduling Scope

CALLING SEQUENCE:

```
#include <pthread.h>

int pthread_attr_setscope(
    pthread_attr_t *attr,
    int contentionscope
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The contention scope specified is not valid.
- ENOTSUP: The contention scope specified (PTHREAD_SCOPE_SYSTEM) is not supported.

DESCRIPTION:

The `pthread_attr_setscope` routine is used to set the contention scope field in the thread attribute object `attr` to the value specified by `contentionscope`.

The `contentionscope` must be either PTHREAD_SCOPE_SYSTEM to indicate that the thread is to be within system scheduling contention or PTHREAD_SCOPE_PROCESS indicating that the thread is to be within the process scheduling contention scope.

NOTES:

As required by POSIX, RTEMS defines the feature symbol _POSIX_THREAD_PRIORITY_SCHEDULING to indicate that the family of routines to which this routine belongs is supported.
17.4.10 pthread_attr_getscope - Get Thread Scheduling Scope

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_getscope(
    const pthread_attr_t *attr,
    int *contentionscope
);
```

STATUS CODES:

- **EINVAL**: The attribute pointer argument is invalid.
- **EINVAL**: The attribute set is not initialized.
- **EINVAL**: The contentionscope pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_getscope` routine is used to obtain the value of the contention scope field in the thread attributes object `attr`. The current value is returned in `contentionscope`.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.11 `pthread_attr_setinheritsched` - Set Inherit Scheduler Flag

**CALLING SEQUENCE:**

```c
#include <pthread.h>

int pthread_attr_setinheritsched(
    pthread_attr_t *attr,
    int inheritsched
);
```

**STATUS CODES:**

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.
- **EINVAL** The specified scheduler inheritance argument is invalid.

**DESCRIPTION:**

The `pthread_attr_setinheritsched` routine is used to set the inherit scheduler field in the thread attribute object `attr` to the value specified by `inheritsched`.

The `contentionscope` must be either `PTHREAD_INHERIT_SCHED` to indicate that the thread is to inherit the scheduling policy and parameters from the creating thread, or `PTHREAD_EXPLICIT_SCHED` to indicate that the scheduling policy and parameters for this thread are to be set from the corresponding values in the attributes object. If `contentionscope` is `PTHREAD_INHERIT_SCHED`, then the scheduling attributes in the `attr` structure will be ignored at thread creation time.

**NOTES:**

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.12 pthread_attr_getinheritsched - Get Inherit Scheduler Flag

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_getinheritsched(
    const pthread_attr_t *attr,
    int *inheritsched
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- EINVAL: The inheritsched pointer argument is invalid.

DESCRIPTION:

The `pthread_attr_getinheritsched` routine is used to object the current value of the inherit scheduler field in the thread attribute object `attr`.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.13 pthread_attr_setschedpolicy - Set Scheduling Policy

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_setschedpolicy(
    pthread_attr_t *attr,
    int policy
);
```

STATUS CODES:

- EINVAL: The attribute pointer argument is invalid.
- EINVAL: The attribute set is not initialized.
- ENOTSUP: The specified scheduler policy argument is invalid.

DESCRIPTION:

The `pthread_attr_setschedpolicy` routine is used to set the scheduler policy field in the thread attribute object `attr` to the value specified by `policy`.

Scheduling policies may be one of the following:

- SCHED_DEFAULT
- SCHED_FIFO
- SCHED_RR
- SCHED_SPORADIC
- SCHED_OTHER

The precise meaning of each of these is discussed elsewhere in this manual.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.14 pthread_attr_getschedpolicy - Get Scheduling Policy

CALLING SEQUENCE:

#include <pthread.h>

int pthread_attr_getschedpolicy(
    const pthread_attr_t *attr,
    int *policy
);

STATUS CODES:

EINVAL      The attribute pointer argument is invalid.
EINVAL      The attribute set is not initialized.
EINVAL      The specified scheduler policy argument pointer is invalid.

DESCRIPTION:

The pthread_attr_getschedpolicy routine is used to obtain the scheduler policy field from the thread attribute object attr. The value of this field is returned in policy.

NOTES:

As required by POSIX, RTEMS defines the feature symbol _POSIX_THREAD_PRIORITY_SCHEDULING to indicate that the family of routines to which this routine belongs is supported.
17.4.15 pthread_attr_setschedparam - Set Scheduling Parameters

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_attr_setschedparam(
    pthread_attr_t *attr,
    const struct sched_param param
);
```

STATUS CODES:

- **EINVAL** The attribute pointer argument is invalid.
- **EINVAL** The attribute set is not initialized.
- **EINVAL** The specified scheduler parameter argument is invalid.

DESCRIPTION:

The `pthread_attr_setschedparam` routine is used to set the scheduler parameters field in the thread attribute object `attr` to the value specified by `param`.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.16 pthread_attr_getschedparam - Get Scheduling Parameters

CALLING SEQUENCE:

```
#include <pthread.h>

int pthread_attr_getschedparam(
    const pthread_attr_t *attr,
    struct sched_param   *param
);
```

STATUS CODES:

- EINVAL The attribute pointer argument is invalid.
- EINVAL The attribute set is not initialized.
- EINVAL The specified scheduler parameter argument pointer is invalid.

DESCRIPTION:

The `pthread_attr_getschedparam` routine is used to obtain the scheduler parameters field from the thread attribute object `attr`. The value of this field is returned in `param`.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.17 pthread_create - Create a Thread

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_create(
    pthread_t *thread,
    const pthread_attr_t *attr,
    void (*start_routine)( void *),
    void *arg
);
```

STATUS CODES:

- EINVAL The attribute set is not initialized.
- EINVAL The user specified a stack address and the size of the area was not large enough to meet this processor's minimum stack requirements.
- EINVAL The specified scheduler inheritance policy was invalid.
- ENOTSUP The specified contention scope was PTHREAD_SCOPE_PROCESS.
- EINVAL The specified thread priority was invalid.
- EINVAL The specified scheduling policy was invalid.
- EINVAL The scheduling policy was SCHED_SPORADIC and the specified replenishment period is less than the initial budget.
- EINVAL The scheduling policy was SCHED_SPORADIC and the specified low priority is invalid.
- EAGAIN The system lacked the necessary resources to create another thread, or the self imposed limit on the total number of threads in a process PTHREAD_THREAD_MAX would be exceeded.
- EINVAL Invalid argument passed.

DESCRIPTION:

The `pthread_create` routine is used to create a new thread with the attributes specified by `attr`. If the `attr` argument is NULL, then the default attribute set will be used. Modification of the contents of `attr` after this thread is created does not have an impact on this thread.

The thread begins execution at the address specified by `start_routine` with `arg` as its only argument. If `start_routine` returns, then it is functionally equivalent to the thread executing the `pthread_exit` service.

Upon successful completion, the ID of the created thread is returned in the `thread` argument.
NOTES:

There is no concept of a single main thread in RTEMS as there is in a tradition UNIX system. POSIX requires that the implicit return of the main thread results in the same effects as if there were a call to `exit`. This does not occur in RTEMS.

The signal mask of the newly created thread is inherited from its creator and the set of pending signals for this thread is empty.
17.4.18 pthread_exit - Terminate the Current Thread

CALLING SEQUENCE:

```c
#include <pthread.h>

void pthread_exit(
    void *status
);
```

STATUS CODES:

NONE

DESCRIPTION:

The `pthread_exit` routine is used to terminate the calling thread. The `status` is made available to any successful join with the terminating thread.

When a thread returns from its start routine, it results in an implicit call to the `pthread_exit` routine with the return value of the function serving as the argument to `pthread_exit`.

NOTES:

Any cancellation cleanup handlers that have been pushed and not yet popped shall be popped in reverse of the order that they were pushed. After all cancellation cleanup handlers have been executed, if the thread has any thread-specific data, destructors for that data will be invoked.

Thread termination does not release or free any application visible resources including but not limited to mutexes, file descriptors, allocated memory, etc. Similarly, exiting a thread does not result in any process-oriented cleanup activity.

There is no concept of a single main thread in RTEMS as there is in a tradition UNIX system. POSIX requires that the implicit return of the main thread results in the same effects as if there were a call to `exit`. This does not occur in RTEMS.

All access to any automatic variables allocated by the threads is lost when the thread exits. Thus references (i.e. pointers) to local variables of a thread should not be used in a global manner without care. As a specific example, a pointer to a local variable should NOT be used as the return value.
17.4.19 pthread_detach - Detach a Thread

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_detach(
    pthread_t thread
);
```

STATUS CODES:

- **ESRCH**: The thread specified is invalid.
- **EINVAL**: The thread specified is not a joinable thread.

DESCRIPTION:

The `pthread_detach` routine is used to indicate that storage for `thread` can be reclaimed when the thread terminates without another thread joining with it.

NOTES:

If any threads have previously joined with the specified thread, then they will remain joined with that thread. Any subsequent calls to `pthread_join` on the specified thread will fail.
17.4.20 pthread_join - Wait for Thread Termination

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_join(
    pthread_t thread,
    void **value_ptr
);
```

STATUS CODES:

- **ESRCH**: The thread specified is invalid.
- **EINVAL**: The thread specified is not a joinable thread.
- **EDEADLK**: A deadlock was detected or thread is the calling thread.

DESCRIPTION:

The `pthread_join` routine suspends execution of the calling thread until `thread` terminates. If `thread` has already terminated, then this routine returns immediately. The value returned by `thread` (i.e. passed to `pthread_exit`) is returned in `value_ptr`.

When this routine returns, then `thread` has been terminated.

NOTES:

- The results of multiple simultaneous joins on the same thread is undefined.
- If any threads have previously joined with the specified thread, then they will remain joined with that thread. Any subsequent calls to `pthread_join` on the specified thread will fail.
- If `value_ptr` is NULL, then no value is returned.
17.4.21 pthread_self - Get Thread ID

CALLING SEQUENCE:

#include <pthread.h>

pthread_t pthread_self( void );

STATUS CODES:

The value returned is the ID of the calling thread.

DESCRIPTION:

This routine returns the ID of the calling thread.

NOTES:

NONE
17.4.22 pthread_equal - Compare Thread IDs

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_equal(
    pthread_t t1,
    pthread_t t2
);
```

STATUS CODES:

- **zero**
  - The thread ids are not equal.

- **non-zero**
  - The thread ids are equal.

DESCRIPTION:

The `pthread_equal` routine is used to compare two thread IDs and determine if they are equal.

NOTES:

The behavior is undefined if the thread IDs are not valid.
17.4.23 pthread_once - Dynamic Package Initialization

CALLING SEQUENCE:

```c
#include <pthread.h>

pthread_once_t once_control = PTHREAD_ONCE_INIT;

int pthread_once(
    pthread_once_t *once_control,
    void (*init_routine)(void)
);
```

STATUS CODES:
NONE

DESCRIPTION:

The `pthread_once` routine is used to provide controlled initialization of variables. The first call to `pthread_once` by any thread with the same `once_control` will result in the `init_routine` being invoked with no arguments. Subsequent calls to `pthread_once` with the same `once_control` will have no effect.

The `init_routine` is guaranteed to have run to completion when this routine returns to the caller.

NOTES:

The behavior of `pthread_once` is undefined if `once_control` is automatic storage (i.e. on a task stack) or is not initialized using `PTHREAD_ONCE_INIT`. 
17.4.24 pthread_setschedparam - Set Thread Scheduling Parameters

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_setschedparam(
    pthread_t thread,
    int policy,
    struct sched_param *param
);
```

STATUS CODES:

- **EINVAL**
  The scheduling parameters indicated by the parameter param is invalid.
- **EINVAL**
  The value specified by policy is invalid.
- **EINVAL**
  The scheduling policy was SCHED_SPORADIC and the specified replenishment period is less than the initial budget.
- **EINVAL**
  The scheduling policy was SCHED_SPORADIC and the specified low priority is invalid.
- **ESRCH**
  The thread indicated was invalid.

DESCRIPTION:

The `pthread_setschedparam` routine is used to set the scheduler parameters currently associated with the thread specified by `thread` to the policy specified by `policy`. The contents of `param` are interpreted based upon the `policy` argument.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
17.4.25 pthread_getschedparam - Get Thread Scheduling Parameters

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_getschedparam(
    pthread_t thread,
    int *policy,
    struct sched_param *param
);
```

STATUS CODES:

- EINVAL: The policy pointer argument is invalid.
- EINVAL: The scheduling parameters pointer argument is invalid.
- ESRCH: The thread indicated by the parameter thread is invalid.

DESCRIPTION:

The `pthread_getschedparam` routine is used to obtain the scheduler policy and parameters associated with `thread`. The current policy and associated parameters values returned in `policy` and `param`, respectively.

NOTES:

As required by POSIX, RTEMS defines the feature symbol `_POSIX_THREAD_PRIORITY_SCHEDULING` to indicate that the family of routines to which this routine belongs is supported.
18 Key Manager

18.1 Introduction

The key manager ...

The directives provided by the key manager are:

- `pthread_key_create` - Create Thread Specific Data Key
- `pthread_key_delete` - Delete Thread Specific Data Key
- `pthread_setspecific` - Set Thread Specific Key Value
- `pthread_getspecific` - Get Thread Specific Key Value

18.2 Background

There is currently no text in this section.

18.3 Operations

There is currently no text in this section.

18.4 Directives

This section details the key manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
18.4.1  pthread_key_create - Create Thread Specific Data Key

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_key_create(
    pthread_key_t *key,
    void (*destructor)( void )
);
```

STATUS CODES:

- **EAGAIN**: There were not enough resources available to create another key.
- **ENOMEM**: Insufficient memory exists to create the key.
18.4.2 pthread_key_delete - Delete Thread Specific Data Key

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_key_delete(
pthread_key_t key,
);
```

STATUS CODES:

EINVAL The key was invalid

DESCRIPTION:

NOTES:
18.4.3 pthread_setspecific - Set Thread Specific Key Value

CALLING SEQUENCE:

```c
#include <pthread.h>

int pthread_setspecific(
    pthread_key_t key,
    const void *value
);
```

STATUS CODES:

EINVAL The specified key is invalid.

DESCRIPTION:

NOTES:
18.4.4 pthread_getspecific - Get Thread Specific Key Value

CALLING SEQUENCE:

```c
#include <pthread.h>

void *pthread_getspecific(
    pthread_key_t key
);
```

STATUS CODES:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>There is no thread-specific data associated with the specified key.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>The data associated with the specified key.</td>
</tr>
</tbody>
</table>

DESCRIPTION:

NOTES:
19 Thread Cancellation Manager

19.1 Introduction

The thread cancellation manager is ...

The directives provided by the thread cancellation manager are:

- `pthread_cancel` - Cancel Execution of a Thread
- `pthread_setcancelstate` - Set Cancelability State
- `pthread_setcanceltype` - Set Cancelability Type
- `pthread_testcancel` - Create Cancellation Point
- `pthread_cleanup_push` - Establish Cancellation Handler
- `pthread_cleanup_pop` - Remove Cancellation Handler

19.2 Background

There is currently no text in this section.

19.3 Operations

There is currently no text in this section.

19.4 Directives

This section details the thread cancellation manager’s directives. A subsection is dedicated to each of this manager’s directives and describes the calling sequence, related constants, usage, and status codes.
19.4.1 pthread_cancel - Cancel Execution of a Thread

**NOTES:**
20 Services Provided by C Library (libc)

20.1 Introduction

This section lists the routines that provided by the Newlib C Library.

20.2 Standard Utility Functions (stdlib.h)

- abort - Abnormal termination of a program
- abs - Integer absolute value (magnitude)
- assert - Macro for Debugging Diagnostics
- atexit - Request execution of functions at program exit
- atof - String to double or float
- atoi - String to integer
- bsearch - Binary search
- calloc - Allocate space for arrays
- div - Divide two integers
- ecvtbuf - Double or float to string of digits
- ecvt - Double or float to string of digits (malloc result)
- __env_lock - Lock environment list for getenv and setenv
- gvcvt - Format double or float as string
- exit - End program execution
- getenv - Look up environment variable
- labs - Long integer absolute value (magnitude)
- ldiv - Divide two long integers
- malloc - Allocate memory
- realloc - REALLOCate memory
- free - Free previously allocated memory
- mallinfo - Get information about allocated memory
- __malloc_lock - Lock memory pool for malloc and free
- mbstowcs - Minimal multibyte string to wide string converter
- mblen - Minimal multibyte length
- mbtowc - Minimal multibyte to wide character converter
- qsort - Sort an array
- rand - Pseudo-random numbers
- strtod - String to double or float
- strtol - String to long
- strtoul - String to unsigned long
- system - Execute command string
- wcstombs - Minimal wide string to multibyte string converter
- wctomb - Minimal wide character to multibyte converter

20.3 Character Type Macros and Functions (ctype.h)

- isalnum - Alphanumeric character predicate
- isalpha - Alphabetic character predicate
- isascii - ASCII character predicate
- iscntrl - Control character predicate
- isdigit - Decimal digit predicate
- islower - Lower-case character predicate
- isprint - Printable character predicates (isprint, isgraph)
- ispunct - Punctuation character predicate
- isspace - Whitespace character predicate
- isupper - Uppercase character predicate
- isxdigit - Hexadecimal digit predicate
- toascii - Force integers to ASCII range
- tolower - Translate characters to lower case
- toupper - Translate characters to upper case

20.4 Input and Output (stdio.h)

- clearerr - Clear file or stream error indicator
- fclose - Close a file
- feof - Test for end of file
- ferror - Test whether read/write error has occurred
- fflush - Flush buffered file output
- fgetc - Get a character from a file or stream
- fgetpos - Record position in a stream or file
- fgets - Get character string from a file or stream
- fprintf - Write formatted output to file (integer only)
- fopen - Open a file
- fdopen - Turn an open file into a stream
- fputc - Write a character on a stream or file
- fputs - Write a character string in a file or stream
- fread - Read array elements from a file
- freopen - Open a file using an existing file descriptor
- fseek - Set file position
• fsetpos - Restore position of a stream or file
• ftell - Return position in a stream or file
• fwrite - Write array elements from memory to a file or stream
• getc - Get a character from a file or stream (macro)
• getchar - Get a character from standard input (macro)
• gets - Get character string from standard input (obsolete)
• iprintf - Write formatted output (integer only)
• mktemp - Generate unused file name
• perror - Print an error message on standard error
• putc - Write a character on a stream or file (macro)
• putchar - Write a character on standard output (macro)
• puts - Write a character string on standard output
• remove - Delete a file's name
• rename - Rename a file
• rewind - Reinitialize a file or stream
• setbuf - Specify full buffering for a file or stream
• setvbuf - Specify buffering for a file or stream
• siprintf - Write formatted output (integer only)
• printf - Write formatted output
• scanf - Scan and format input
• tmpfile - Create a temporary file
• tmpnam - Generate name for a temporary file
• vprintf - Format variable argument list

20.5 Strings and Memory (string.h)

• bcmp - Compare two memory areas
• bcopy - Copy memory regions
• bzero - Initialize memory to zero
• index - Search for character in string
• memchr - Find character in memory
• memcmp - Compare two memory areas
• memcpy - Copy memory regions
• memmove - Move possibly overlapping memory
• memset - Set an area of memory
• rindex - Reverse search for character in string
• strcasecmp - Compare strings ignoring case
• strcat - Concatenate strings
• strchr - Search for character in string
• **strcmp** - Character string compare
• **strcoll** - Locale specific character string compare
• **strcpy** - Copy string
• **strcspn** - Count chars not in string
• **_strerror** - Convert error number to string
• **strlen** - Character string length
• **strlwr** - Convert string to lower case
• **strncasecmp** - Compare strings ignoring case
• **strncat** - Concatenate strings
• **strncpy** - Counted copy string
• **strpbrk** - Find chars in string
• **strrchr** - Reverse search for character in string
• **strspn** - Find initial match
• **strstr** - Find string segment
• **strtok** - Get next token from a string
• **strupr** - Convert string to upper case
• **strxfrm** - Transform string

### 20.6 Signal Handling (signal.h)
• **raise** - Send a signal
• **signal** - Specify handler subroutine for a signal

### 20.7 Time Functions (time.h)
• **asctime** - Format time as string
• **clock** - Cumulative processor time
• **ctime** - Convert time to local and format as string
• **difftime** - Subtract two times
• **gmtime** - Convert time to UTC (GMT) traditional representation
• **localtime** - Convert time to local representation
• **mktime** - Convert time to arithmetic representation
• **strftime** - Flexible calendar time formatter
• **time** - Get current calendar time (as single number)

### 20.8 Locale (locale.h)
• **setlocale** - Select or query locale
20.9 Reentrant Versions of Functions

- Equivalent for errno variable:
  - errno_r - XXX

- Locale functions:
  - localeconv_r - XXX
  - setlocale_r - XXX

- Equivalents for stdio variables:
  - stdin_r - XXX
  - stdout_r - XXX
  - stderr_r - XXX

- Stdio functions:
  - fdopen_r - XXX
  - perror_r - XXX
  - tempnam_r - XXX
  - fopen_r - XXX
  - putchar_r - XXX
  - tmpnam_r - XXX
  - getchar_r - XXX
  - puts_r - XXX
  - tmpfile_r - XXX
  - gets_r - XXX
  - remove_r - XXX
  - fprintf_r - XXX
  - printf_r - XXX
  - rename_r - XXX
  - vsnprintf_r - XXX
  - mktime_r - XXX
  - snprintf_r - XXX
  - vsprintf_r - XXX
  - mktemp_r - XXX
  - sprintf_r - XXX

- Signal functions:
  - init_signal_r - XXX
  - signal_r - XXX
  - kill_r - XXX
  - _sigtramp_r - XXX
  - raise_r - XXX

- Stdlib functions:
• calloc_r - XXX
• mblen_r - XXX
• srand_r - XXX
• dtoa_r - XXX
• mbstowcs_r - XXX
• strtod_r - XXX
• free_r - XXX
• mbtowc_r - XXX
• strtol_r - XXX
• getenv_r - XXX
• memalign_r - XXX
• strtoul_r - XXX
• mallocinfo_r - XXX
• mstats_r - XXX
• system_r - XXX
• malloc_r - XXX
• rand_r - XXX
• wcstombs_r - XXX
• malloc_r - XXX
• realloc_r - XXX
• wctomb_r - XXX
• malloc_stats_r - XXX
• setenv_r - XXX
• String functions:
  • strtok_r - XXX
• System functions:
  • close_r - XXX
  • link_r - XXX
  • unlink_r - XXX
  • execve_r - XXX
  • lseek_r - XXX
  • wait_r - XXX
  • fcntl_r - XXX
  • open_r - XXX
  • write_r - XXX
  • fork_r - XXX
  • read_r - XXX
  • fstat_r - XXX
  • sbrk_r - XXX
Chapter 20: Services Provided by C Library (libc)

- gettimeofday_r - XXX
- stat_r - XXX
- getpid_r - XXX
- times_r - XXX
- Time function:
  - asctime_r - XXX

20.10 Miscellaneous Macros and Functions

- unctrl - Return printable representation of a character

20.11 Variable Argument Lists

- Stdarg (stdarg.h):
  - va_start - XXX
  - va_arg - XXX
  - va_end - XXX
- Vararg (varargs.h):
  - va_alist - XXX
  - va_start-trad - XXX
  - va_arg-trad - XXX
  - va_end-trad - XXX

20.12 Reentrant System Calls

- open_r - XXX
- close_r - XXX
- lseek_r - XXX
- read_r - XXX
- write_r - XXX
- fork_r - XXX
- wait_r - XXX
- stat_r - XXX
- fstat_r - XXX
- link_r - XXX
- unlink_r - XXX
- sbrk_r - XXX
21 Services Provided by the Math Library (libm)

21.1 Introduction

This section lists the routines that provided by the Newlib Math Library (libm).

21.2 Standard Math Functions (math.h)

- \texttt{acos} - Arccosine
- \texttt{acosh} - Inverse hyperbolic cosine
- \texttt{asin} - Arcsine
- \texttt{asinh} - Inverse hyperbolic sine
- \texttt{atan} - Arctangent
- \texttt{atan2} - Arctangent of \( y/x \)
- \texttt{atanh} - Inverse hyperbolic tangent
- \texttt{jN} - Bessel functions (\( jN \) and \( yN \))
- \texttt{cbrt} - Cube root
- \texttt{copysign} - Sign of \( Y \) and magnitude of \( X \)
- \texttt{cosh} - Hyperbolic cosine
- \texttt{erf} - Error function (erf and erfc)
- \texttt{exp} - Exponential
- \texttt{expm1} - Exponential of \( x \) and - 1
- \texttt{fabs} - Absolute value (magnitude)
- \texttt{floor} - Floor and ceiling (floor and ceil)
- \texttt{fmod} - Floating-point remainder (modulo)
- \texttt{frexp} - Split floating-point number
- \texttt{gamma} - Logarithmic gamma function
- \texttt{hypot} - Distance from origin
- \texttt{ilogb} - Get exponent
- \texttt{infinity} - Floating infinity
- \texttt{isnan} - Check type of number
- \texttt{ldexp} - Load exponent
- \texttt{log} - Natural logarithms
- \texttt{log10} - Base 10 logarithms
- \texttt{log1p} - Log of 1 + \( X \)
- \texttt{matherr} - Modifiable math error handler
- \texttt{modf} - Split fractional and integer parts
- \texttt{nan} - Floating Not a Number
• `nextafter` - Get next representable number
• `pow` - X to the power Y
• `remainder` - remainder of X divided by Y
• `scalbn` - scalbn
• `sin` - Sine or cosine (sin and cos)
• `sinh` - Hyperbolic sine
• `sqrt` - Positive square root
• `tan` - Tangent
• `tanh` - Hyperbolic tangent
22 Status of Implementation

This chapter provides an overview of the status of the implementation of the POSIX API for RTEMS. The *POSIX 1003.1b Compliance Guide* provides more detailed information regarding the implementation of each of the numerous functions, constants, and macros specified by the POSIX 1003.1b standard.

RTEMS supports many of the process and user/group oriented services in a "single user/single process" manner. This means that although these services may be of limited usefulness or functionality, they are provided and do work in a coherent manner. This is significant when porting existing code from UNIX to RTEMS.

- Implementation
  - The current implementation of `dup()` is insufficient.
  - FIFOs `mkfifo()` are not currently implemented.
  - Asynchronous IO is not implemented.
  - The `flockfile()` family is not implemented
  - `getc/putc` unlocked family is not implemented
  - Shared Memory is not implemented
  - Mapped Memory is not implemented
- NOTES:
  - For Shared Memory and Mapped Memory services, it is unclear what level of support is appropriate and possible for RTEMS.

- Functional Testing
  - Tests for unimplemented services

- Performance Testing
  - There are no POSIX Performance Tests.

- Documentation
  - Many of the service description pages are not complete in this manual. These need to be completed and information added to the background and operations sections.
  - Example programs (not just tests) would be very nice.

Concept Index

A
- acquire ownership of file stream .......... 150
- add a signal to a signal set ............ 18
- associate asynchronous stream with file descriptor .......... 149
- asynchronous file synchronization .......... 130
- asynchronous read .......................... 123
- asynchronous write .......................... 124

B
- broadcast a condition variable .......... 219

C
- cancel asynchronous i/o request .......... 128
- cancel execution of a thread .......... 306
- change access and/or modification times of a file ........... 97
- change file mode .................................. 230
- change permissions of a file ............ 94
- changes the current working directory ....... 71, 72
- changes the owner and/or group of a file ...... 96
- check permissions for a file ............ 92
- close a message queue ....................... 262
- close a named semaphore ................. 185
- closes a file .................................. 112
- compare thread ids ......................... 295
- create a directory .......................... 104
- create a new file or rewrite an existing one .......... 76
- create a process .................................. 4
- create a thread ............................... 289
- create an inter ................................ 109
- create cancellation point .................. 309
- create session and set process group id .......... 52
- creates a link to a file .................. 79
- creates a symbolic link to a file .......... 80
- duplicates an open file descriptor .......... 110, 111
- dynamic package initialization .......... 296
- dynamically set the priority ceiling .......... 209

E
- empty a signal set ........................ 22
- ends directory read operation .......... 70
- establish cancellation handler .......... 310
- examine and change process blocked signals .......... 25
- examine and change signal action .......... 23
- examine and change thread blocked signals .......... 26
- examine pending signals .......... 28
- execute a file .............................. 5, 6, 7, 8, 9, 10

F
- fill a signal set ............................. 20

G
- generate terminal pathname .............. 58
- get character from stdin without locking .......... 154
- get character without locking .......... 153
- get clock resolution ................. 244
- get configurable system variables .......... 62
- get detach state ....................... 276
- get directory entries .................... 95
- get effective group id .................. 45
- get effective user id .................... 43
- get environment variables ............ 56
- get group file entry for id .......... 170
- get group file entry for name .......... 172
- get inherit scheduler flag .......... 284
- get maximum priority value .......... 238
- get message queue attributes .......... 269
- get minimum priority value .......... 237
- get parent process id ............... 41
- get password file entry for uid .......... 174
- get process group id .......... 51
- get process id ............................. 40
- get process shared attribute .......... 215
- get process times ................. 55
- get real group id ..................... 44
- get scheduling parameters .......... 288
- get scheduling policy .............. 286
- get supplementary group ids .......... 48
- get system name .......................... 54
- get the blocking protocol .......... 198
- get the current priority ceiling .......... 210
- get the priority ceiling .......... 200
- get the time of day ............... 247
- get the value of a semaphore .......... 191
- get the visibility ..................... 202
get thread id .......................... 294
get thread scheduling parameters .... 298
get thread scheduling scope ........... 282
get thread stack address ............... 280
get thread stack size ................... 278
get time in seconds .................... 248
get timeslicing quantum ............... 230
get user id ............................ 42
get user name .......................... 49
get user name, reentrant .............. 50
gets configuration values for files ... 100, 102
gets current working directory .......... 73
gets file status ........................ 90, 91
gets foreground process group id ........ 142
gets information about a file .......... 89
gets terminal attributes ............... 136

I
initialize a condition variable ........ 216
initialize a condition variable attribute set ... 212
initialize a mutex ..................... 203
initialize a mutex attribute set ....... 195
initialize a thread attribute set ...... 273
initialize an unnamed semaphore ...... 181
initialize time conversion information 161
is signal a member of a signal set ...... 21

L
list directed i/o ........................ 125
lock a mutex ........................... 205
lock a mutex with timeout ............. 207
lock a range of the process address space 226
lock the address space of a process ... 224

M
makes a directory ...................... 82
makes a fifo special file .............. 83
manipulates an open file descriptor ... 116
map process addresses to a memory object 228
memory object synchronization ........ 231
mount a file system ................... 121

N
non ...................................... 158, 160, 188
notify process that a message is available . 266

O
obtain file descriptor number for this file .... 148
obtain the name of a symbolic link destination . 81
obtain time of day ...................... 81
open a directory ....................... 241
open a message queue .................. 260
open a named semaphore ............... 183
open a shared memory object .......... 232
opens a file ............................ 74

P
password file entry for name .......... 176
poll to acquire ownership of file stream 151
poll to lock a mutex ................... 206
put character to stdin without locking ... 156
put character without locking .......... 155

Q
queue a signal to a process ........... 34

R
reads a directory ...................... 66
reads from a file ...................... 113
reads terminal input baud rate ........ 132
reads terminal output baud rate ........ 133
receive a message from a message queue 265
reentrant determine terminal device name 60
reentrant extract token from string ... 162
reentrant get group file entry .......... 171
reentrant get group file entry for name 173
reentrant get password file entry for name .... 177
reentrant get password file entry for uid 175
reentrant get user name ............... 50
reentrant local time conversion ....... 166
reentrant random number generation ... 167
reentrant struct tm to ascii time conversion 163
reentrant time_t to ascii time conversion 164
reentrant utc time conversion ......... 165
register fork handlers ................. 11
release ownership of file stream .... 152
remove a message queue ............... 263
remove a shared memory object ....... 233
remove cancellation handler .......... 311
removes a directory entry .......... 84
renames a file ........................ 87
reposition read/write file offset ...... 118
resets the readdir() pointer .......... 67
retrieve error status of asynchronous i/o operation 126
retrieve return status asynchronous i/o operation 127
return current location in directory stream ... 69
